and

**J.R. SCHOUTEN**

Breure, A. S. H. & J. R. Schouten: Notes on and descriptions of Bulimulidae (Mollusca, Gastropoda), III.

Zool. Verh. Leiden 216,27-ii-1985: 1-98, figs. 1-33, pls. 1-4. — ISSN 024-1652.

Key words: Bulimulidae; anatomy; catalogue.

Notes are given on the systematic status and/or the anatomy of species of the subfamilies Odontostominae, Orthalicinae and Placostylinae. Furthermore the variation in mandibula and radula of 28, respectively 27, species is analysed. Anatomical data are presented for 25 species and 3 species are redescribed.

A. S. H. Breure, Schapenrustweg 5, 2351 NK Leiderdorp, The Netherlands.

**INTRODUCTION**

In this publication, which is a continuation of the recent publications of Breure (1978) and Breure & Eskens (1981), we deal with the subfamilies Odontostominae, Orthalicinae and Placostylinae. Data on Amphibuliminiae may be found in Breure (1974b). The data given in this paper have been used in the revision of the Bulimulinae, which was recently published by one of us (Breure, 1979).

The following abbreviations are used to refer to the location of the specimens: AM — Australian Museum, Sydney; AUM — Auckland Institute and Museum, Auckland; BBM — B. P. Bishop Museum, Honolulu; BMNH — British Museum (Natural History), London; CM — Carnegie Museum, Pittsburgh; DZSP — Departamento de Zoologia, Universidade de São Paulo, São Paulo; MBM — Museo de Malacología, Habana; MCZ — Museum of Comparative Zoology, Cambridge, Mass.; MN — Museu Nacional, Rio de Janeiro; MNHN — Muséum National d'Histoire Naturelle, Paris; NMWC — National Museum of Wales, Cardiff; NZGS — New Zealand Geological Survey, Wellington; RMNH — Rijksmuseum van Natuurlijke Historie, Leiden; SMF — Natur-Museum Senckenberg, Frankfurt am Main; UF — Florida State Museum, Gainesville; USNM, United States National Museum, Wash-

ington D.C.; ZMB — Zoologisches Museum, Berlin; ZMuz — Zoologisches Museum, Universität Zürich.

Moreover, the following abbreviations are used to refer to parts of the anatomy: AG — albumen gland; D — diaphragma; EP — epiphallus; FL — flagellum; GA — genital atrium; O — ovotestis; OD — ovotestis duct; O-EP — outlet of epiphallus in penis; OV — oviduct; P — penis; PA — penis appendix; PR — prostate; PS — penis sheath; RM — retractor muscle; RS — receptaculum seminis; SD — spermathecal duct; SOV — spermoviduct; SP — spermatheca; V — vagina; VD — vas deferens.

The histology was studied with the following methods: after embedding in paraffin the material was sectioned at 7 $\mu$ m and stained with 1% Alcian Blue after kaliumpermanganate oxidation, followed by staining with Haemalum and Eosin-erythrosin in ethanol 80%. The slides were mounted in malinol and have been deposited in the Rijksmuseum van Natuurlijke Historie, Leiden.

This research was made possible by grant W 87-96 of the Foundation for the Advancement of Tropical Research (WOTRO), for which the senior author wants to express his sincere gratitude.

Without the generous help of the staff of the British Museum (Natural History), Mollusca Section, the task of tracing type specimens in their collection could not have been completed. Furthermore the following persons deserve our gratitude as they kindly lent us material from the collections in their charge: A. Andersson (Stockholm), A. dos Santos Coelho (Rio de Janeiro), R. Fechter (München), J. F. Peake and his staff (London), F. G. Thompson (Gainesville), and S. Tillier (Paris).

We wish to express a special word of thanks to Prof. dr. J. T. Wiebes (Leiden) for his stimulating interest. For technical assistance with our research we are much obliged to Mr. S. Ploeger, for assistance with the photographs we wish to thank Mr. A. 't Hooft, both from the Division of Systematic Zoology, University of Leiden.

## SUBFAMILY ODONTOSTOMINAE

### SYSTEMATICS

#### **Hyperaulax (Hyperaulax) ridleyi (E. A. Smith, 1890)**

The type material of this species is preserved in the British Museum (Natural History). The holotype (BMNH 1888.6.27.106) measures: shell height 11.4

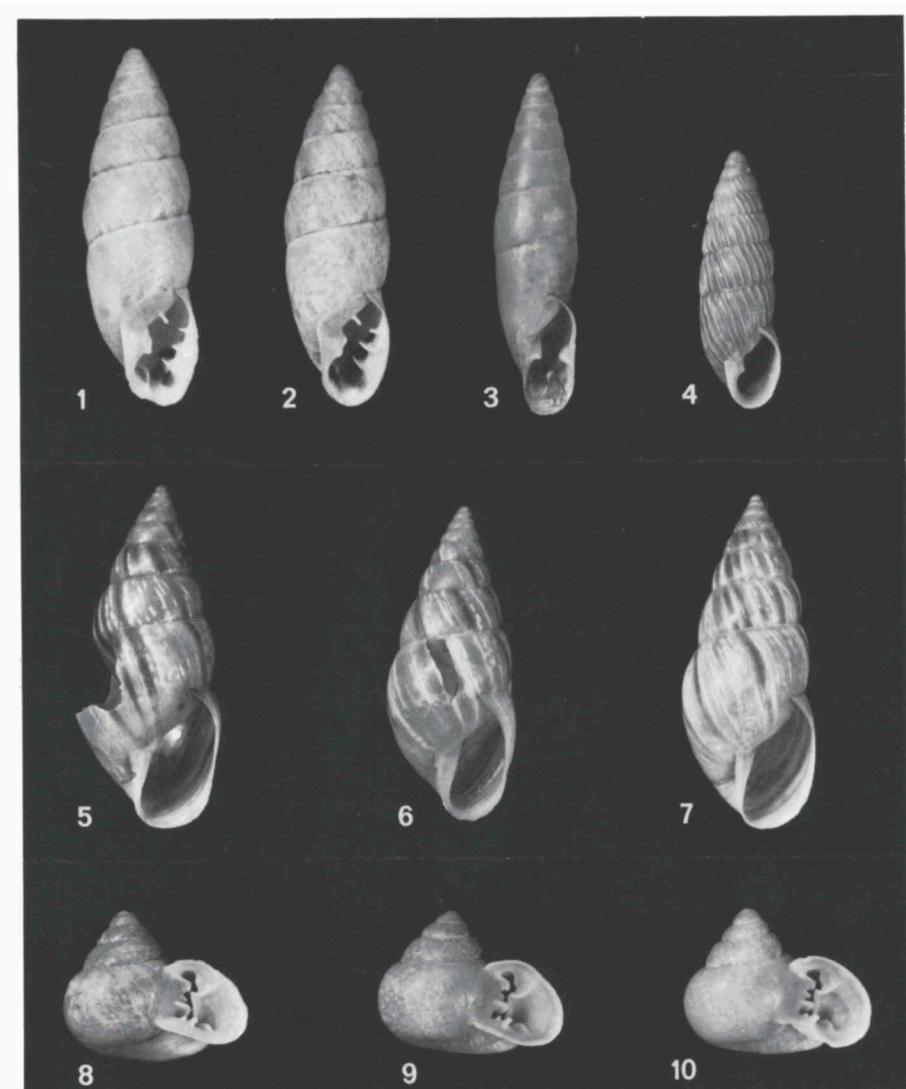

Plate 1. Figs. 1, 2. *Cyclodontina* (*C.*) *fusiformis* (Menke), lectotype (fig. 1) and paralectotype of *Bulimus catharinæ* Pfeiffer (BMNH); shell height 24.5 mm. Fig. 3. *Cyclodontina* (*Bahiensis*) *occultus* (Reeve), holotype (BMNH); shell height 24.0 mm. Fig. 4. *Clessinia costata* (Pfeiffer), lectotype (BMNH); shell height 18.0 mm. Figs. 5-7. *Anctus sugillatus* (Pfeiffer), lectotype (fig. 5) and paralectotypes (BMNH); shell height 23.5 mm. Figs. 8-10. *Tomigerus turbinatus* (Pfeiffer), lectotype (fig. 8) and paralectotypes (BMNH); shell height 10.3 mm.

mm, diameter 5.9 mm. There are four paratypes and the material is labelled "Fernando Noronha" (ex Royal Society).

**Anctus sugillatus** (Pfeiffer, 1857)  
(pl. 1 figs. 5-7)

One specimen from among the type specimens in the London museum is designated lectotype: shell height 23.5 mm, diameter 10.8 mm (BMNH 1975259). There are two paralectotypes and the material is labelled "Bolivia" (ex Cuming). The species is figured here for the first time.

**Cyclodontina (Cyclodontina) fusiformis** (Menke, 1828)  
(pl. 1 figs. 1, 2)

After having compared descriptions and material of both taxa, we now consider *Bulimus catharinae* Pfeiffer, 1857, a junior subjective synonym of *Scarabus fusiformis* Menke, 1828. The type material of *Bulimus catharinae* Pfeiffer is in the British Museum (Natural History) and one specimen is here designated lectotype: shell height 24.5 mm, diameter 7.6 mm (BMNH 1975261). The material, which includes two paralectotypes, is labelled "St. Catherines Brazil" (ex Cuming). This taxon is here figured for the first time.

**Cyclodontina (Cyclodontina) tadiculatus** (Martens, 1868)  
(fig. 1)

Genitalia. — Penis with a very short sheath (ca. 1/24 the length of the phallus), subcylindrical, passing without external differentiation into the epiphallus. The flagellum is more or less subcylindrical, ca. 1/5 the length of the phallus, with a retractor muscle inserted at the distal end. The vas deferens is about as long as the penis and epiphallus together. The vagina is short (ca. 1/12 the length of the phallus). The spermathecal duct is more or less subcylindrical, with a globose spermatheca at the distal end, and as long as the spermoviduct.

Material. — Brazil, Edo. Santa Catarina, Nova Teutonia (NRS).

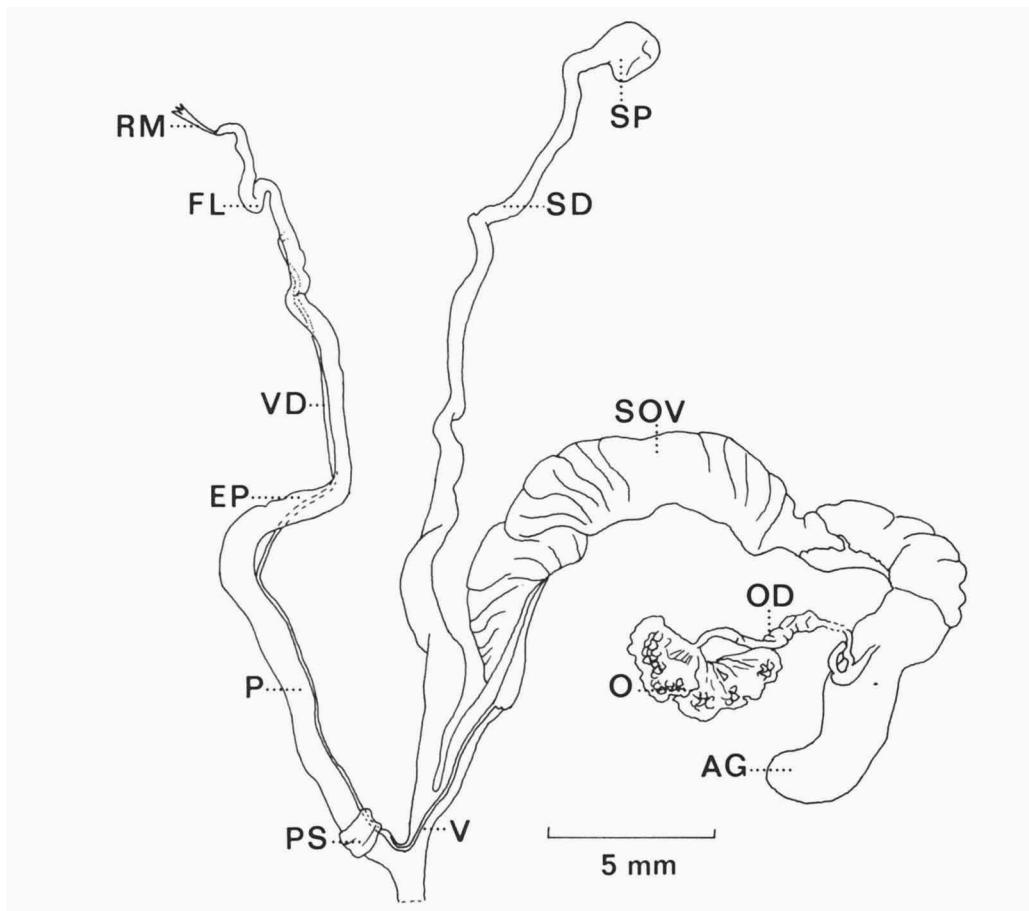

Fig. 1. *Cyclodontina (Cyclodontina) tudiculatus* (Martens), genitalia. Brazil, Edo. Santa Catarina, Nova Teutonia (NRS).

***Cyclodontina (Bahiensis) occultus* (Reeve, 1849)**  
(pl. 1 fig. 3)

A type specimen in the London museum is here designated lectotype: shell height 24.0 mm, diameter 6.3 mm (BMNH 1975258). It is labelled "Brazil" (ex Cuming).

Type material of *Bulimus paralellus* Pfeiffer, 1857, which is considered, by Pilsbry (1901: 48), a junior synonym of *Bulimus occultus* Reeve, is also preserved in the London museum. One specimen is designated lectotype: shell height 22.5 mm, diameter 7.0 mm (BMNH 1975256). There is one para-

lectotype, which is also labelled "St. Catherines, Brazil" (ex Cuming). Additionally, there is one specimen from Brazil, Espirito Santo (ex Miers) identified by Pfeiffer as *B. paralellus*.

**Cyclodontina (Bahiensis?) rhodinostoma (d'Orbigny, 1835)**  
(fig. 2)

Genitalia. — Phalluscomplex relatively long. Penis with a very short proximal sheath (ca. 1/15 the length of the phallus), subcylindrical, passing without external differentiation into the epiphallus. The flagellum is short (ca. 1/8 the

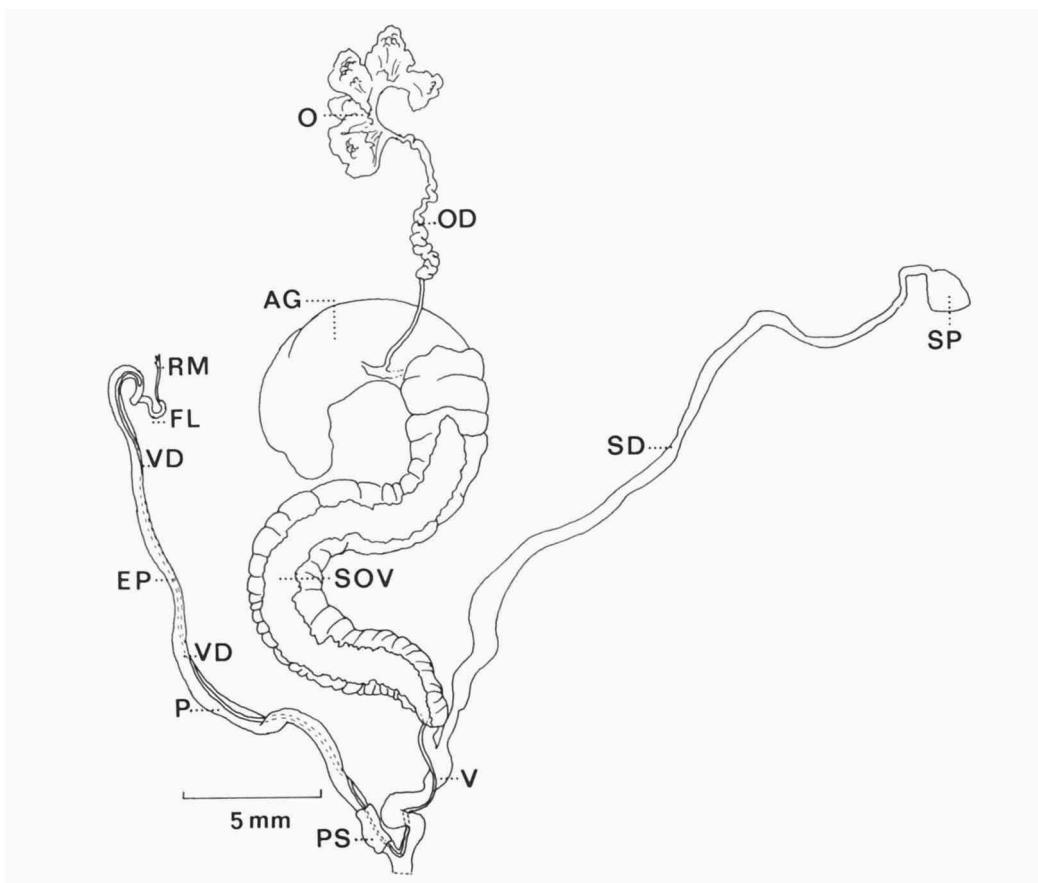

Fig. 2. *Cyclodontina (Bahiensis?) rhodinostoma* (d'Orbigny), genitalia. Brazil, Edo. Rio de Janeiro, Petropolis, Taguara (MN).

length of the phallus), slender and with a distally inserted retractor muscle. The vas deferens passes through the proximal sheath, but runs otherwise freely alongside penis and epiphallus. The vagina is subcylindrical, (ca. 1/5 the length of the phallus). The spermathecal duct is more or less tapering, with a globose spermatheca at the distal end. Spermoviduct without prominent twistings. Ovotestis duct about half as long as spermoviduct; ovotestis with lobes.

Material. — Brazil, Estado Rio de Janeiro, Petropolis, Taguara (MN, RMNH).

**Clessinia cordovana stelzneri (Döring, 1874)**

(fig. 3)

Genitalia. — Penis with a very short sheath, subcylindrical; with a retractor muscle attached to the distal part of the penis. The phallus is constricted at the

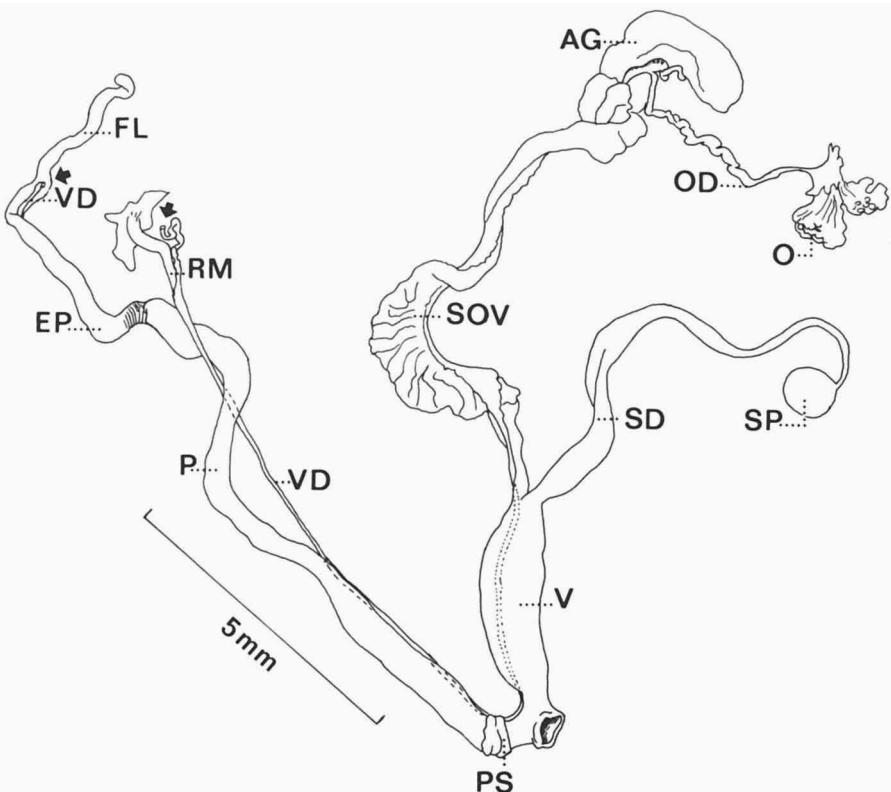

Fig. 3. *Clessinia cordovana stelzneri* (Döring), genitalia. Argentina, Prov. Cordova, Quilino (RMNH).

transition between penis and ephiphallus, which is subcylindrical and about as broad as the penis. The flagellum is short ca. 1/5 the length of the phallus) and slightly tapering. The vas deferens is passing through the proximal penis sheath and through the penis retractor muscle; it is much shorter than penis and epiphallus together, which are thus contorted. Vagina broad, except the proximal part that is narrow. Spermathecal duct more or less tapering, with a globose spermatheca; about as long as spermoviduct. Spermoviduct without prominent twisting. Ovotestis duct about half the length of the spermoviduct; ovotestis with lobes.

Material — Argentina, Prov. Cordoba, Quilino (RMNH).

**Clessinia costata** (Pfeiffer, 1848)

(pl. 1 fig. 4)

One specimen from among the type material, which is preserved in the British Museum (Natural History), is here designated lectotype: shell height 18.0 mm, diameter 5.5 mm (BMNH 1975250). There are two paralectotypes and the material is labelled "Brazil" (ex Cuming).

**Clessinia neglecta** (Pfeiffer, 1847)

The type material of this species has been located in the London museum and one specimen is designated lectotype: shell height 17.0 mm, diameter 5.4 mm (BMNH 1975263). The material, which includes one paralectotype, is labelled "Brazils" (ex Cuming) in Pfeiffer's handwriting.

**Clessinia oblitus** (Reeve, 1848)

The specimen corresponding to the original figure (Reeve, 1848: pl. 56 fig. 376) is here designated lectotype: shell height 21.0 mm, diameter 6.8 mm (BMNH 1975254). There are two paralectotypes and the material is labelled "Brazil".

***Spixia aconigastana* (Döring, 1876)**  
 (fig. 4)

**Genitalia.** — Penis with a very short sheath, subcylindrical; with a retractor muscle at the distal end of the penis. A constriction at the transition from penis to epiphallus, which is subcylindrical and about half as broad as the penis. The flagellum is tapering and about 1/5 the length of the phallus. Epiphallus and flagellum embedded in membranes, also including the retractor muscle. The vas deferens is much shorter than penis and epiphallus together and passing through penis sheath and retractor muscle. The vagina is rather swollen, except the proximal part, which is narrow. Spermathecal duct tapering, with a globose spermatheca. Spermoviduct without prominent twistings. Ovotestis duct about 1/3 the length of the spermoviduct; ovotestis with lobes.

**Material.** — Argentina, Prov. Cordoba, Depto. Pocho, Chancani (RMNH).

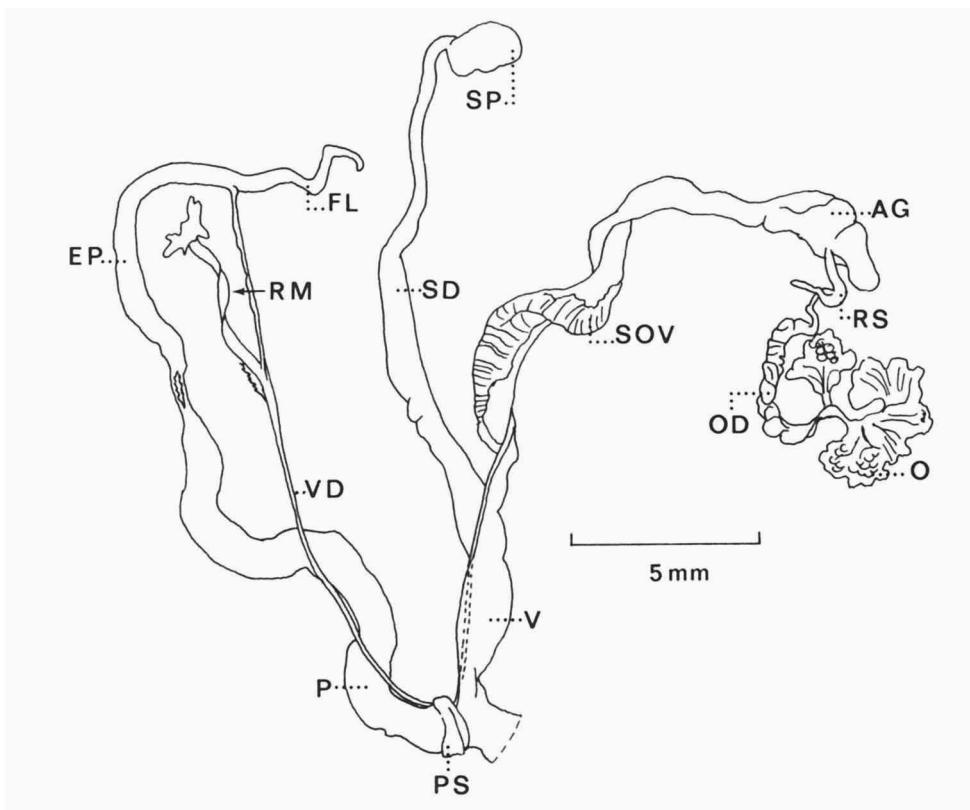

Fig. 4. *Spixia aconigastana* (Döring), genitalia. Argentina, Prov. Cordova, Chancani (RMNH).

***Spixia doellojuradoi* (Parodiz, 1941)**  
 (figs. 5, 6)

Genitalia. — Penis with a very short sheath subcylindrical, the retractor muscle attached to the distal end. A constriction marks the transition between penis and epiphallus, which is subcylindrical and about half as long as the

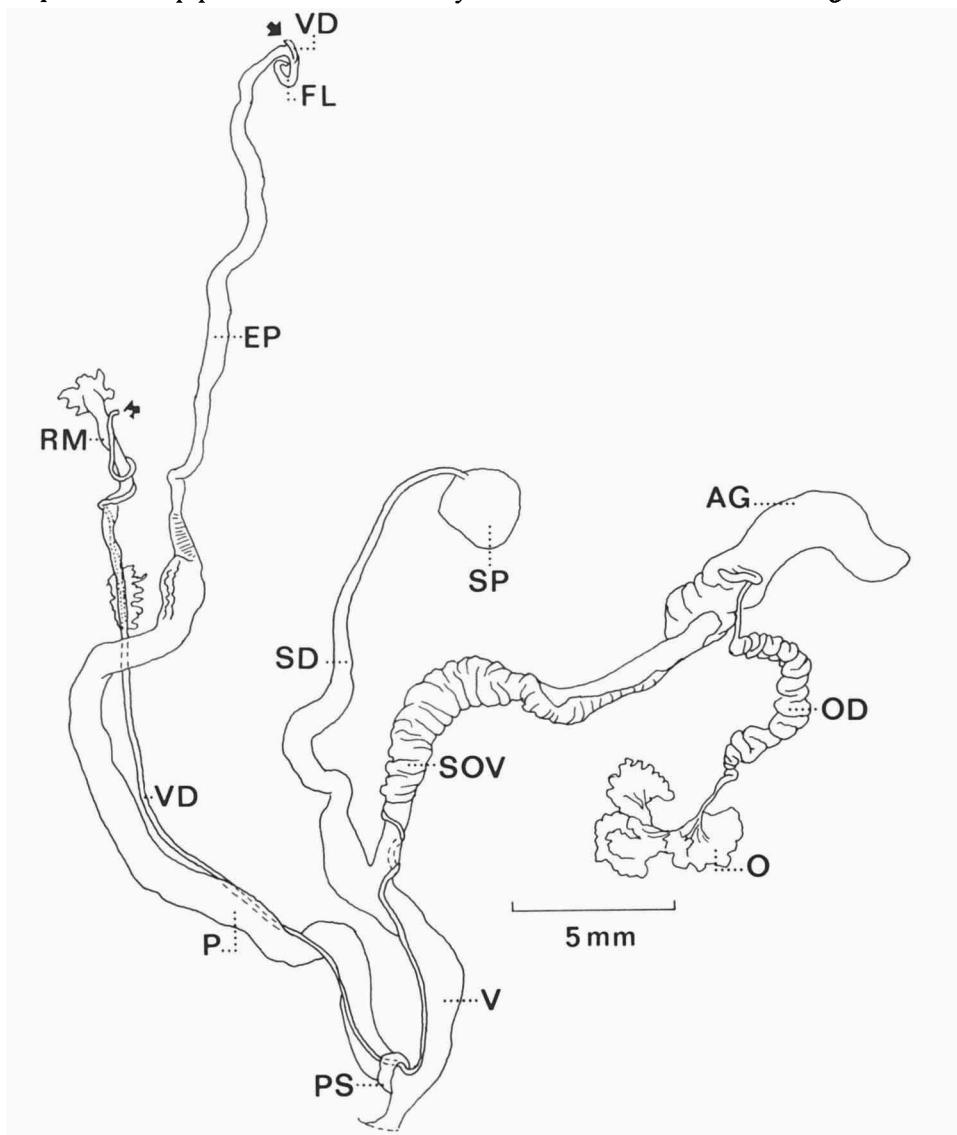

Fig. 5. *Spixia doellojuradoi* (Parodiz), genitalia. Argentina, Prov. Cordova, Pampa Alta between Caminiaga and San Pedro (RMNH).

penis. The flagellum is tapering and about 1/25 the length of the phallus. Epiphallus and flagellum are embedded in membranes, which also include the retractor muscle. The vas deferens is much shorter than penis and epiphallus together and is passing through the penis sheath and the retractor muscle. The

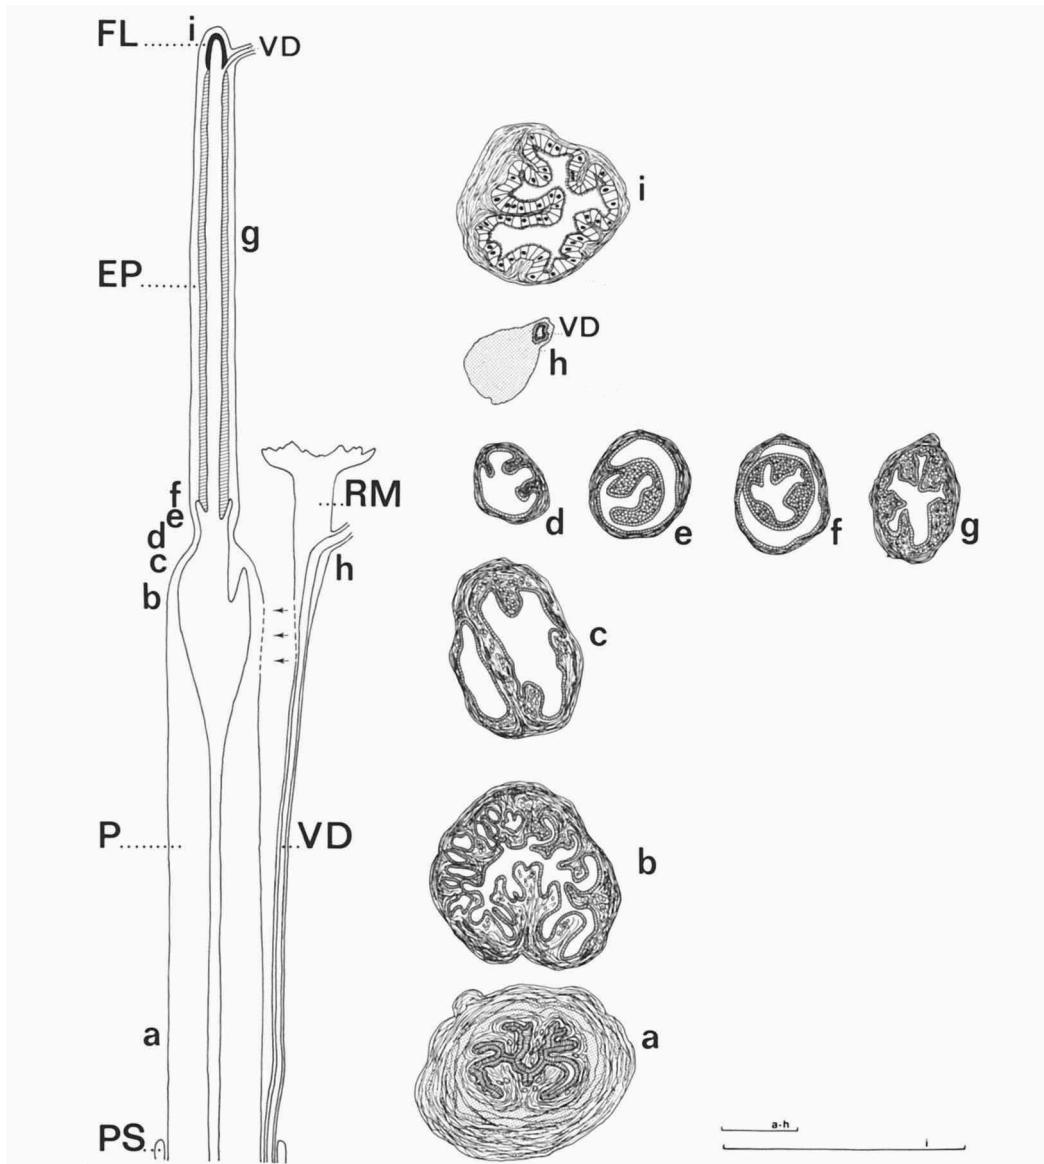

Fig. 6. *Spixia doellojuradoi* (Parodiz). Argentina, Pampa Alta. Schematic reconstruction of penile complex and transverse sections of penis (a-e), epiphallus (e-g) and flagellum (i). Scale lines equal 0.5 mm.

vagina is swollen, with its proximal part narrow. The spermathecal duct is tapering, with a globose spermatheca. Ovotestis duct about half the length of the spermoviduct, which is without prominent twistings; ovotestis with lobes.

Histology. — The lumen of the proximal part of the penis is narrowed by relatively large infoldings. More distally these infoldings are smaller; the lumen is wide, with several small blind tubes parallel to the main lumen. In the distal part of the penis the lumen is divided into two parts, of which one part is blindending. The epithelium of the penis is cubic to low cylindrical; in the subepithelial tissue some glandular cells have been observed. The epiphallus penetrates in the distal part of the penis as an open gutter, lined by cubic to low cylindrical cells with short cilia. More distally the lumen is star-shaped. Flagellum with cubic to low-cylindrical epithelium, which bears relatively long cilia.

Material. — Argentina, Prov. Cordoba, Pampa Alta between Caminiaga and San Pedro (RMNH).

**Spixia pyrgula** (Hylton Scott, 1952)  
(fig. 7)

Material from Argentina, Prov. Cordoba, Minas de Cama Cortada (RMNH) has been dissected and the genitalia prove to be essentially the same as those depicted in Hylton Scott (1952: fig. 2).

**Spixia striata** (Spix, 1827)  
(fig. 8)

Studying the sculpture of the protoconch of *Odontostomus* auct., Pilsbry and Vanatta (in Pilsbry, 1898: 57) proposed the name *Spixia* for the species with a sculpture of longitudinal riblets. They selected as type species "*spixii* Pfr., *wagneri* Spix". Pilsbry (1901: 67) corrected this to *O [dontostomus (Spixia)] spixii* Orbigny. This species is now generally known as *Scalarinella (Spixia) spixii* (d'Orbigny).

*Helix spixii* was published without description by d'Orbigny (1835: 21), who stated it to be *Clausilia striata* Spix and ascribed the name to Féruccac. No such name has been published by Féruccac and the authorship thus belongs to d'Orbigny. In the "Voyage dans l'Amérique méridionale" (1837: 320) *Pupa spixii* var. *major* and var. *minor* were described. The variety *major* appears to be synonymous with *Clausilia striata* Spix, while variety *minor* may

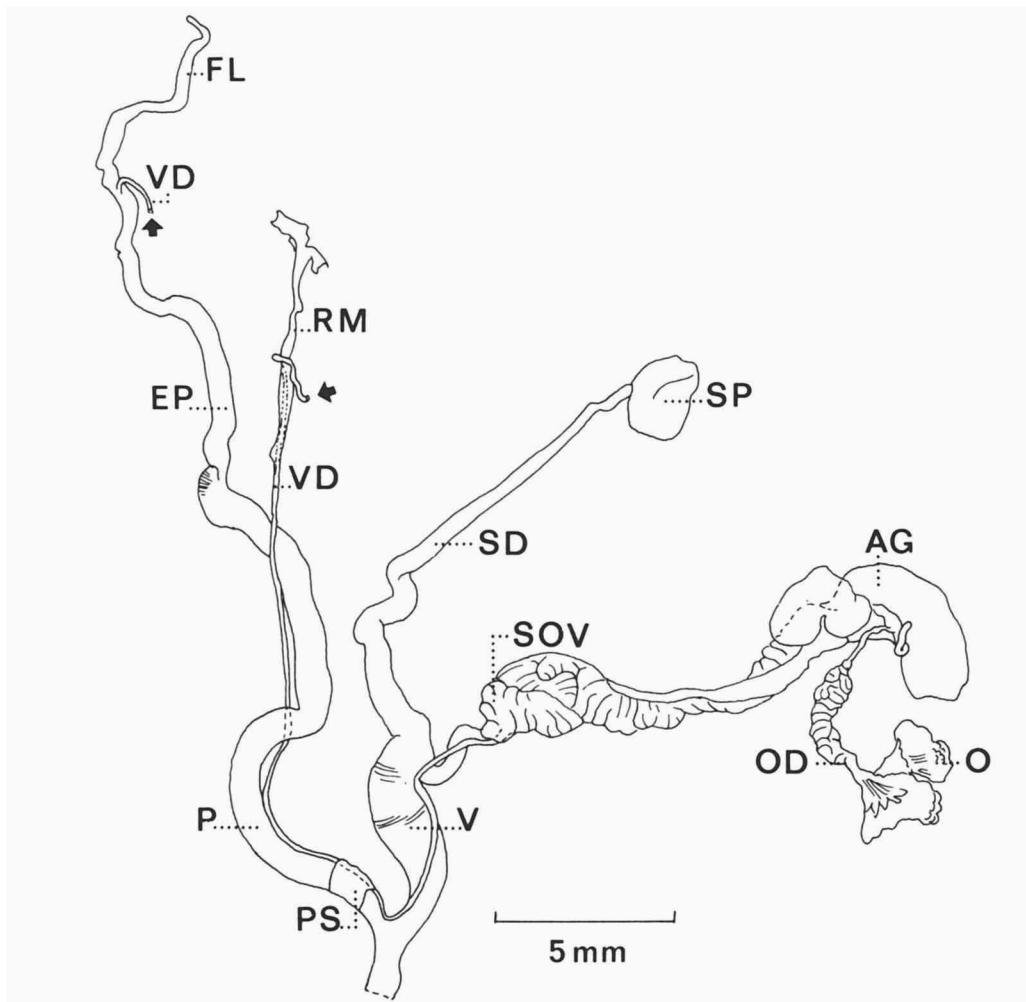

Fig. 7. *Spixia pyrgula* (Hylton Scott), genitalia. Argentina, Prov. Cordova, Minas de Cama Cor-tada (RMNH).

prove to differ subspecifically. Attention may be drawn to the fact that the interpretations of both Pilsbry (1901: 70) and Parodiz (1942: 200-201), viz. to discern *Odontostomus spixii spixii*, *O. s. major* and *O. s. minor*, must be wrong as d'Orbigny never distinguished "typical *spixii*".

The specific name *striata* is not preoccupied in *Clausilia* and there is no reason to follow previous authors, giving preference to the specific name *spixii* d'Orbigny.

The synonymy of this species is thus:

*Pupa striata* Wagner in Spix, 1827: 19. Not *Pupa striata* Schumacher, 1817.  
*Clausilia striata* Spix, 1827: pl. 14 fig. 2.  
*Helix spixii* d'Orbigny, 1835: 21; with vars. *major* and *minor* [nomina nuda].  
*Pupa conspersa* Potiez & Michaud, 1836: 160, pl. 16.  
*Pupa spixii* var. *major* d'Orbigny, 1837: 320.  
*Pupa spixii* var. *minor* d'Orbigny, 1837: 320.  
*Pupa turrita* Anton, 1839: 47.  
*Bulimus wagneri* Pfeiffer, 1842: 124.  
*Odontostomus striatus* var. *bolshi* Martens, 1894: 163.  
*Odontostomus bergi* Boettger & Rolle in Rolle, 1908: 160.  
*Odontostomus (Eudontostomus) saltensis* Holmberg, 1912: 147.

Genitalia. — Penis with a very short sheath, subcylindrical, a retractor muscle attached to the distal end. The transition between the penis and epiphallus is marked by a constriction. The epiphallus is subcylindrical, about half as long and broad as the penis. The flagellum is tapering, ca. 1/8 the length of the phallus. Epiphallus and flagellum are embedded in membranes, which also include the retractor muscle. The vas deferens is much shorter than the penis and epiphallus together and is passing through proximal sheath and retractor muscle. The vagina is rather swollen, but the proximal part is narrow. The spermathecal duct is tapering, with a globose spermatheca. The ovotestis duct is about half as long as the spermoviduct, which is without prominent twistings; ovotestis with lobes.

Material. — Argentina, Prov. Salta, Cerro Colorado (RMNH).

#### ***Spixia striata paraguayana* (Ancey, 1892)**

In the Tucumán museum four topotypes of this subspecies were found, collected in 1955 by M. A. Klappenbach. Their measurements (in mm) are:

shell		aperture		last	number of
height	diameter	height	width	whorl	whorls
36.5	12.2	11.4	9.3	17.0	10.7
36.0	12.2	11.1	8.9	17.0	10.7
36.0	12.2	10.5	8.2	16.0	10.9
35.5	12.1	10.1	8.2	16.0	10.6

#### ***Plagiodontes dealdalea* (Deshayes, 1851)** (fig. 9)

Genitalia. — Penis with a very short sheath, its proximal part subcylindrical; a thick retractor muscle is inserted at the swollen distal part of the penis.

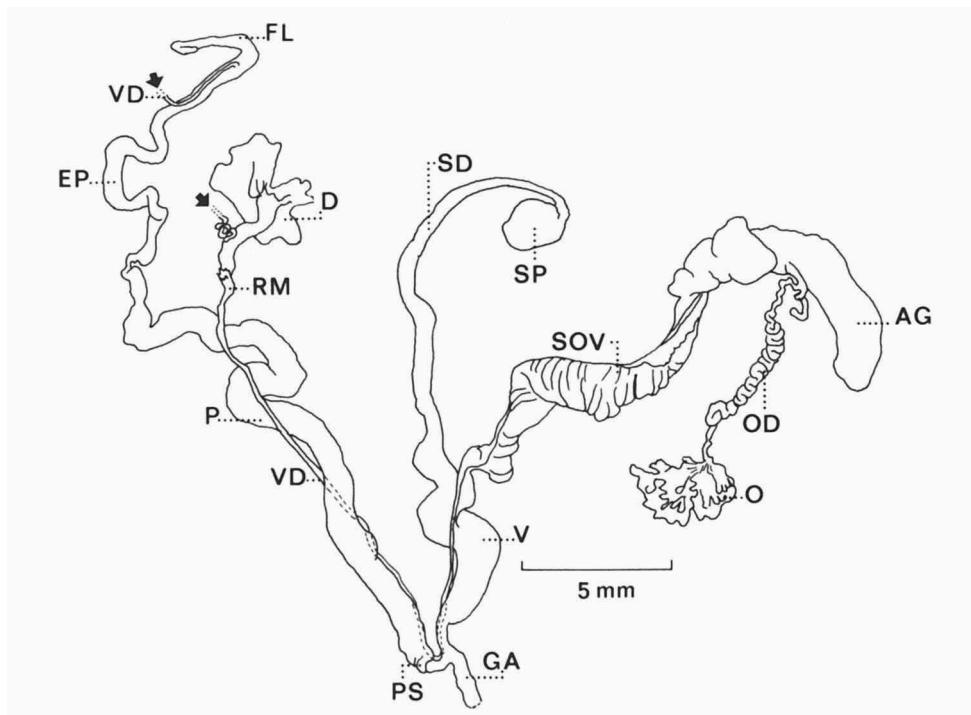

Fig. 8. *Spixia striata* (Spix), genitalia. Argentina, Prov. Salta, Cerro Colorado (RMNH).

The epiphallus is proximally also swollen, but otherwise subcylindrical. The flagellum is more or less subcylindrical and as long as the epiphallus. Both are embedded in membranes, which also include the retractor muscle. The vas deferens is much shorter than penis and epiphallus together and is passing through the retractor muscle. The vagina is rather long (ca. 1/3 the length of the phallus) and tapers towards the genital atrium. The spermathecal duct is slightly longer than the spermoviduct; subcylindrical, with a globose spermatheca at the distal end. The ovotestis duct is about as long as the spermoviduct, which is without prominent twistings; ovotestis with lobes.

Material. — Argentina, Prov. San Luis, Cerro del Morro (RMNH).

**Plagiodontes weyemberghii** (Döring, 1876)  
(figs. 10, 11)

Genitalia. — Penis with a very short sheath, subcylindrical, its distal part strongly swollen; a thick retractor muscle is inserted at the distal end of the

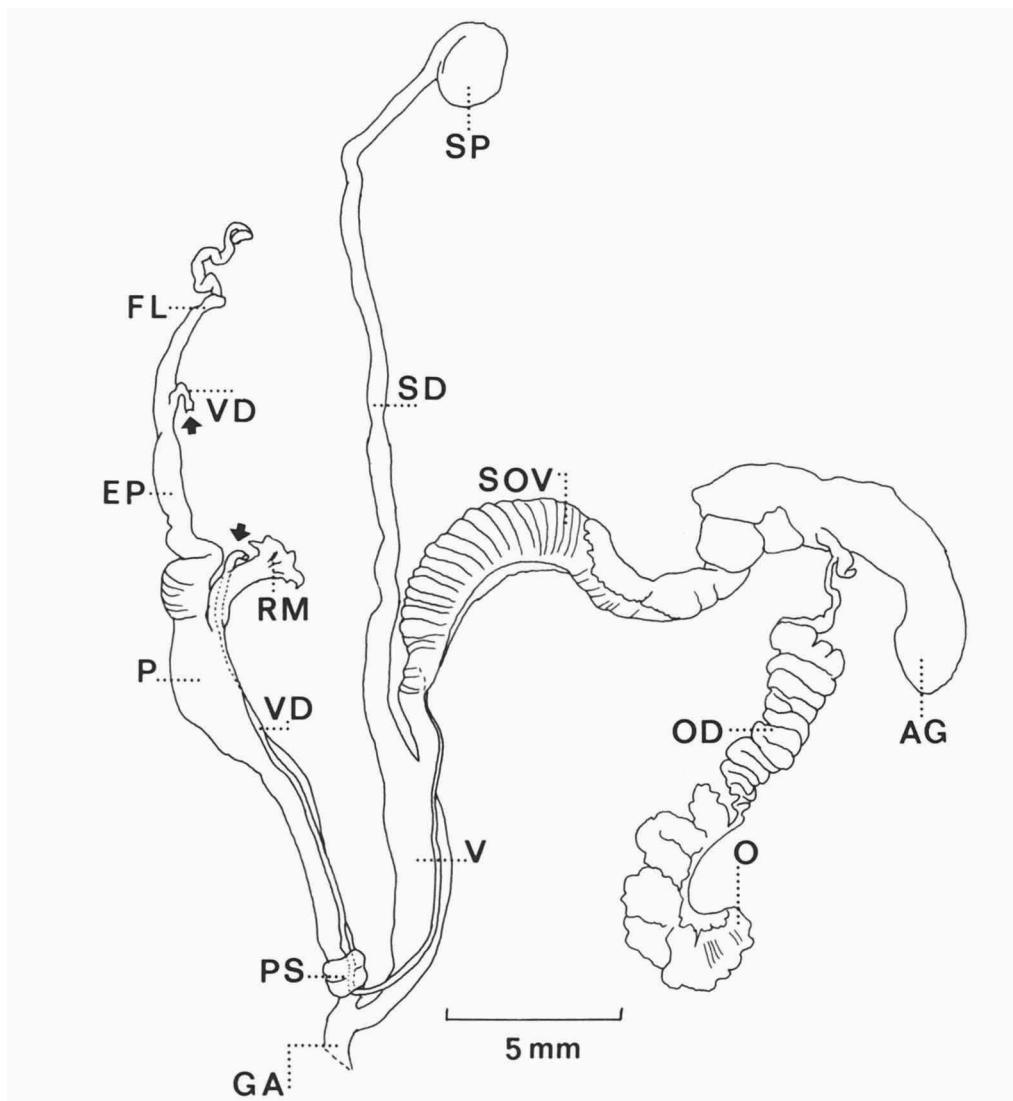

Fig. 9. *Plagiodontes dealdalea* (Deshayes), genitalia. Argentina, Prov. San Luis, Cerro del Morro (RMNH).

penis. The transition between the penis and epiphallus is constricted. The epiphallus is proximally swollen, but otherwise subcylindrical and slightly shorter than the penis. The flagellum is more or less subcylindrical, somewhat longer than the epiphallus; both are embedded in membranes, which also include the retractor muscle. The vas deferens is much shorter than penis and

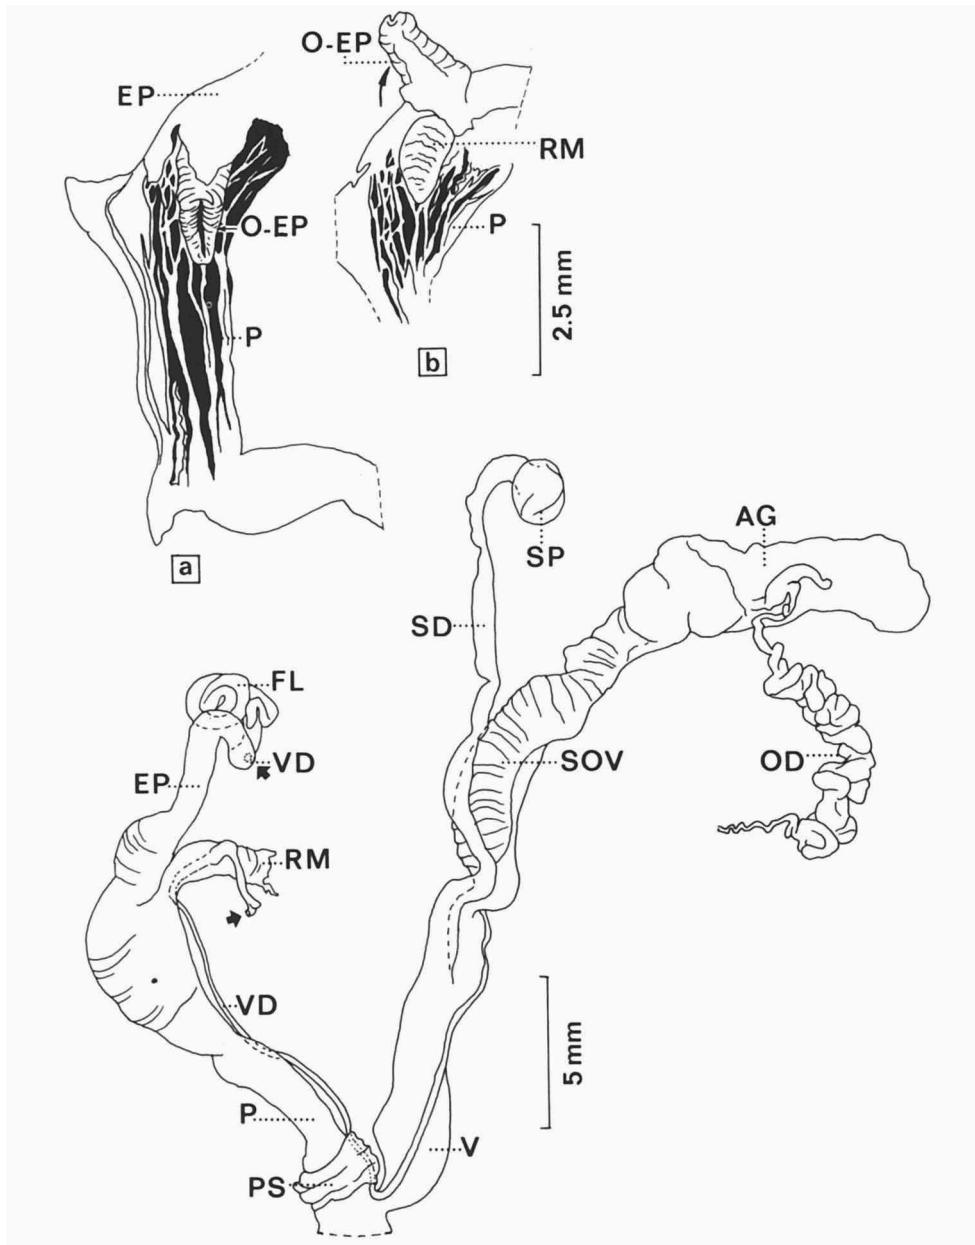

Fig. 10. *Plagiodontes weyembergii* Doering, genitalia. a. internal view of penis with outlet of epiphallus. b. ditto, retractor muscle underneath outlet of epiphallus (folded back). Argentina, Prov. Cordova, Capilla del Monte (RMNH).

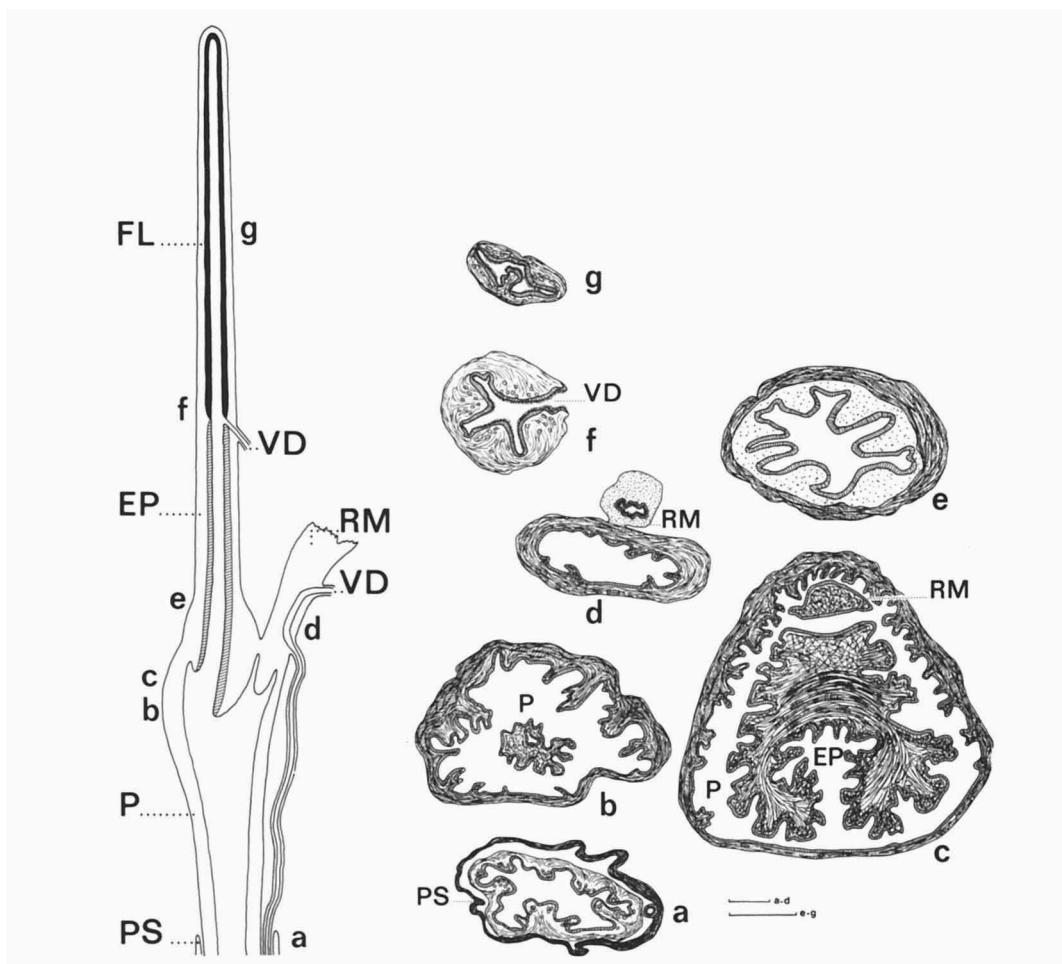

Fig. 11. *Plagiodontes weyembergii* (Doering). Argentina, Capilla del Monte. Schematic reconstruction of penial complex and transverse sections of penis (a-c), epiphallus (c-e) and flagellum (f, g). Scale lines equal 0.5 mm.

epiphallus together, passing through the retractor muscle. The vagina is rather long, broad and tapering towards the genital atrium. The spermathecal duct is subcylindrical and slightly longer than the spermoviduct; the spermatheca is globose. The ovotestis duct is nearly as long as the spermoviduct; ovotestis with lobes.

**Histology.** — Proximal part of the penis with a relatively wide, lobed lumen, lined by a cubic epithelium. More distally the epithelium is low cylindrical. The subepithelial tissue is made up by large, rounded cells which prob-

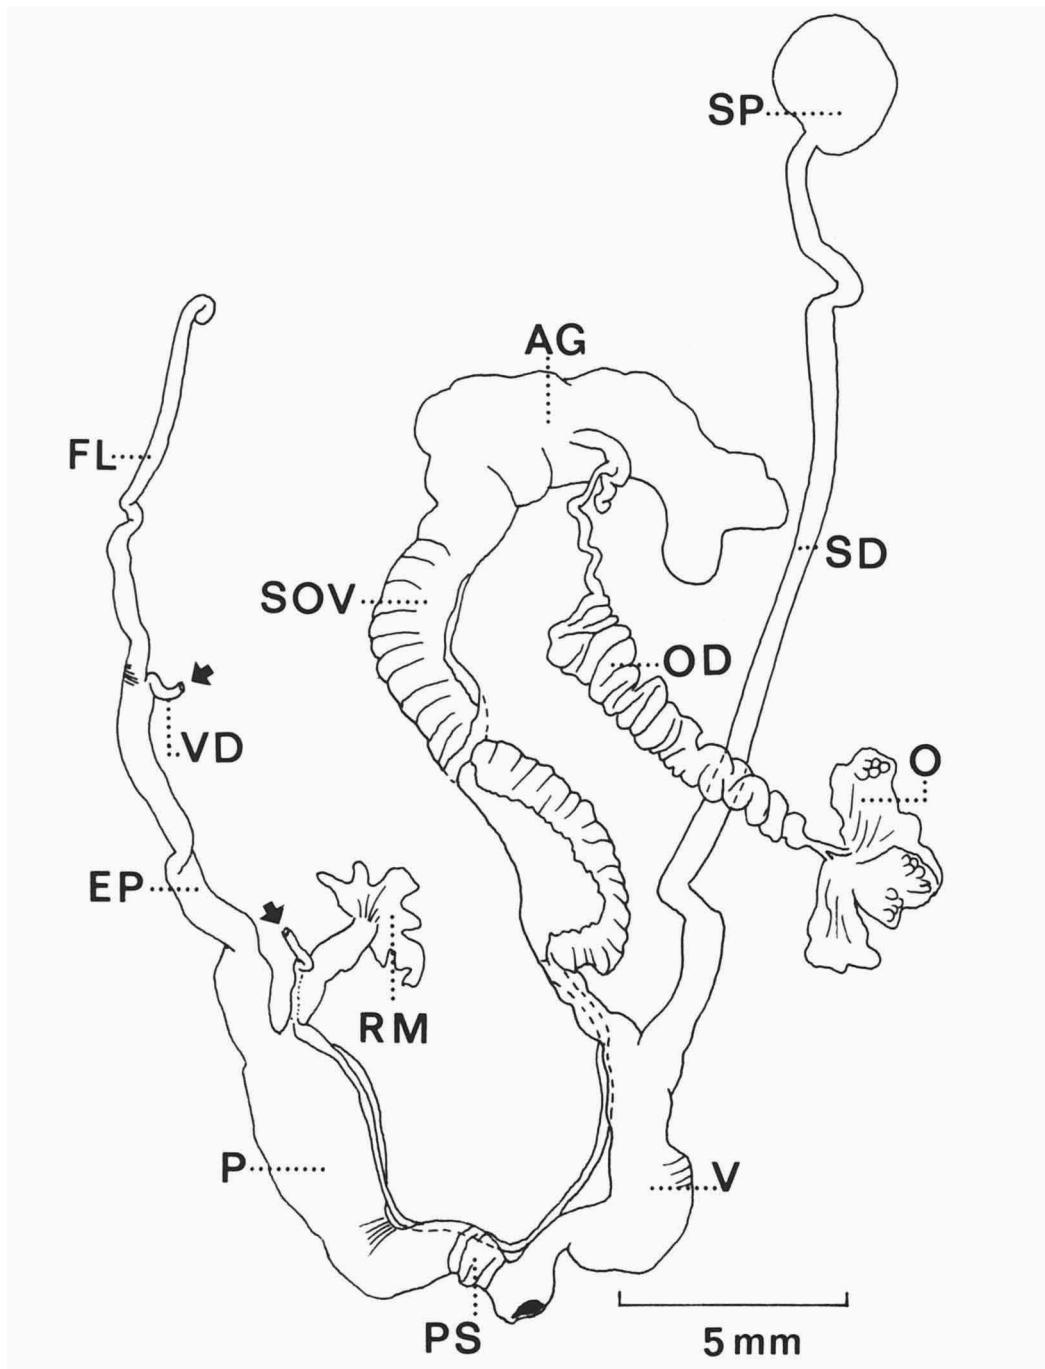

Fig. 12. *Plagiodontes* spec., genitalia. Argentina, Prov. Cordova, La Granja, Alta Gracia (RMNH).

ably have a secretory function. In the most distal part of the penis the lumen is at one side narrowed by short infoldings; the lumen in that part of the penis is penetrated by the proximal part of the epiphallus, of which the lumen forms an open gutter lined by a cubic to low cylindrical ciliated epithelium. The lumen of the distal part of the penis is also penetrated by the penis retractor muscle. The subepithelial tissue of the proximal part of the epiphallus is made up by relatively large cells, which stain violet-blue with Alcian Blue. Flagellum with a star-shaped lumen, which is lined by cylindrical epithelium with relatively long cilia at the apex of the infoldings. The cells gradually change into cubic ones with short cilia towards the sides of these infoldings.

Material. — Argentina, Prov. Cordoba, Capilla del Monte (RMNH).

**Plagiodontes spec.**  
(fig. 12)

The genitalia of this unidentified species closely resemble those of *Plagiodontes dealdalea* and *P. weyemberghii*. The material was collected at Argentina, Prov. Cordoba, La Granja, Alta Gracia (RMNH).

**Odontostomus gargantua** (Férussac, 1821)

One specimen of this taxon, which is the type species of this genus, was collected at Brazil, Edo. Santa Catarina, Nova Teutonia (NRS) and has been dissected. The specimen proved to be juvenile, but the genitalia are essentially the same as those of *Odontostomus paulistus* Pilsbry.

**Odontostomus paulistus** Pilsbry, 1898  
(fig. 13)

Genitalia. — Phallus club-shaped. Penis with a short, thin proximal sheath, passing without external differentiation into the epiphallus. A flagellum is externally not clearly discernable. The vas deferens is relatively broad and enters the phallus at its distal end, where the broad retractor muscle is inserted. The vagina is subcylindrical, ca. 1/3 the length of the phallus. The spermathecal duct is subcylindrical and narrow, about 3/4 the length of the spermoviduct; the spermatheca is globose. The oviduct is broad and swollen. The ovotestis duct is about half as long as the spermoviduct; ovotestis with lobes.

Material. — Brazil, Edo. São Paulo, Ilha da Queimada Grande (RMNH).

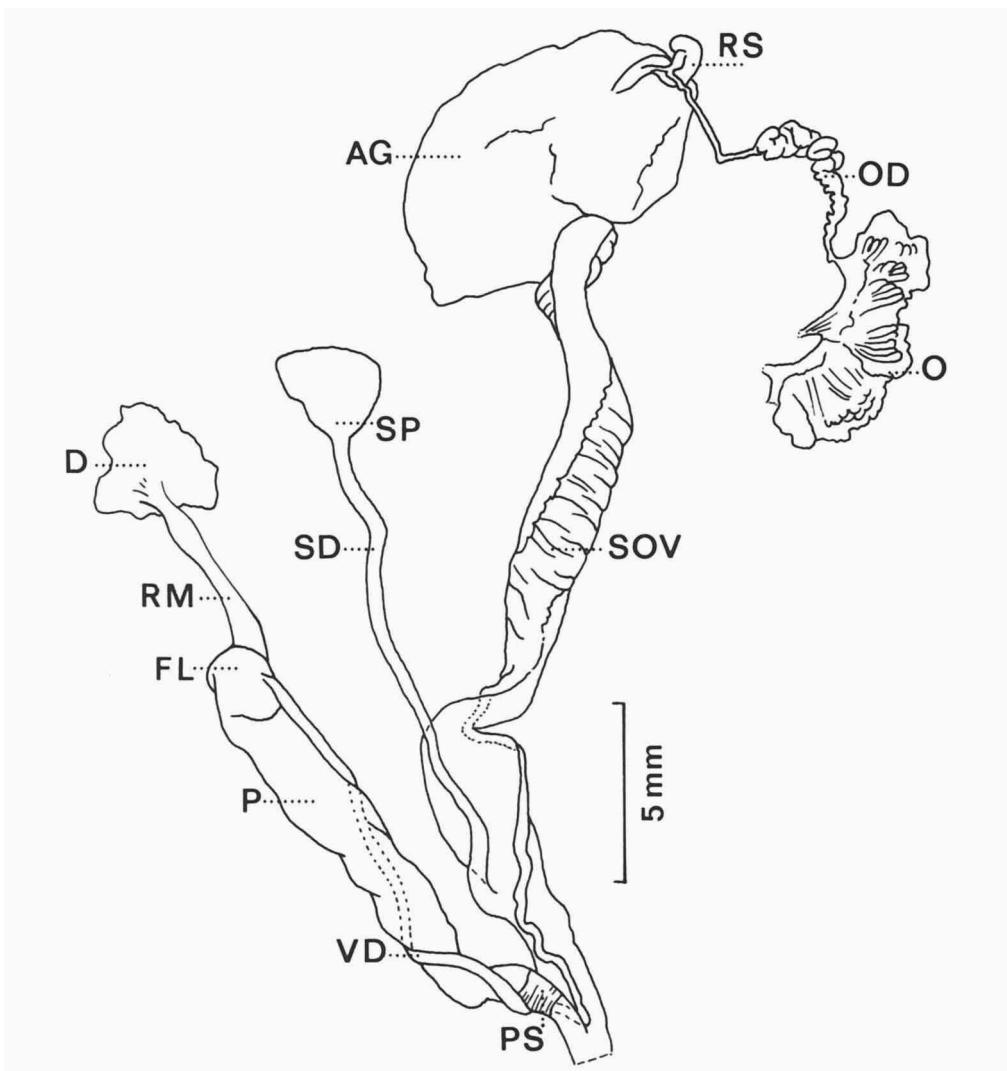

Fig. 13. *Odontostomus paulistus* Pilsbry, genitalia. Brazil, Edo. Sao Paulo, Ilha da Queimada Grande (RMNH).

**Tomigerus (Tomigerus) cumingi (Pfeiffer, 1849)**

A new locality for this species is: Venezuela, Edo. Lara, Municipio Iribarren, Tapa de Piedra, 730 m (UF/1).

**Tomigerus (Tomigerus) turbinatus (Pfeiffer, 1845)**  
 (pl. 1 figs. 8-10)

Three specimens of this species are preserved in the London museum and one of them is designated lectotype: shell height 10.3 mm, diameter 12.7 mm (BMNH 1975253). The material is labelled "Brazil" (ex Cuming).

**Anostoma luetzelburgi Weber, 1925**  
 (fig. 14, pl. 4 fig. 1)

The type material, which is preserved in the München museum, has been studied and one specimen is designated lectotype: shell height 15.5 mm, maximum diameter 30.5 mm, minimum diameter 24.0 mm.

**Redescription.** — Shell up to 16.0 mm high, 0.52 times as long as wide, biconvex, hardly rimate; rather thin. Colour light brown to whitish, the last whorl with dark brown spots and more or less spiral streaks. A continuous dark brown band is present below the suture and on the periphery; the sutural band continues on the upper whorls. The surface is shining; the growth striae on the upper whorls tend to form puckered bands; the penultimate and the last whorl with fine spiral striae and striolation in between. Whorls 4.4, rather

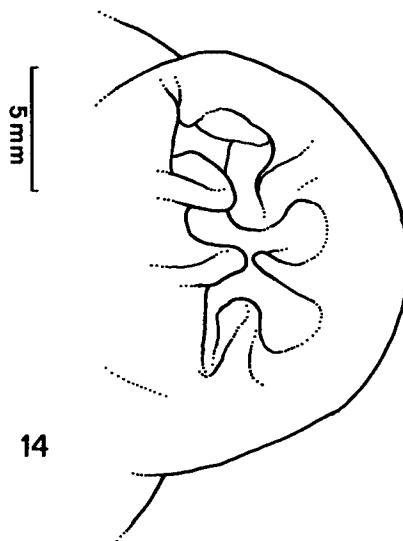

Fig. 14. *Anostoma luetzelburgi* Weber. Brazil, Goyas, Serra Geral/Bahia, S. Disiderio; lectotype, detail of aperture (München museum).

convex, the last whorl slightly acute at the periphery; suture hardly to well impressed. Aperture subhorizontal, semicircular. Peristome strongly expanded and reflexed, rather thick; parietal callus whitish, spreading over the preceding whorls. Parietal region with three lamellae: a small angularis and subequal parietalis and infraparietalis, of which the last mentioned is less curved. Outer lip with two straight and three curved lamellae: subequal columellaris and palatalis inferior that are both slightly curved; a large S-shaped palatalis superior; a small horizontal suprapalatalis and a small suturalis. The angularis and suturalis form a narrow fissure in the peristome.

Measurements (in mm):

shell height	maximum diameter	number of whorls	
15.5	30.5	4.5	lectotype
16.0	30.5	4.5	
15.5	30.0	4.5	
15.5	27.5	4.1	
14.2	29.0	4.0	
13.9	27.5	4.1	
14.9	29.5	4.5	
14.6	27.5	4.4	

*Anostoma rossi* Weber, 1925

(fig. 15, pl. 4 fig. 2)

The type specimens of this species are kept in the München museum and have been studied.

Redescription. — Shell up to 16.0 mm, 0.51 times as long as wide, biconvex, rimate; rather solid. Colour light brown or roseate to whitish, the last whorl with dark brown spots and more or less with spiral streaks. A continuous dark brown band is present below the suture and on the periphery. The surface is slightly shining; the growth striae on the upper whorls tend to form puckered bands; the penultimate and last whorl with fine spiral striae and striolation in between. The lower side of the last whorl with malleated pits ("vertieften Punkten" in Weber's description). Whorls 4.3, rather convex, the last whorl slightly acute at the periphery; suture hardly impressed. Aperture subhorizontal, semicircular. Peristome expanded and reflected, rather thick; parietal callus whitish, spreading over the penultimate whorl. Parietal region with three lamellae: a small angularis, a large and slightly curved parietalis and a straight infraparietalis. Outer lip with five straight lamellae: a rather small columellaris and palatalis inferior, a large palatalis superior and small suprapalatalis and suturalis. The angularis and suturalis form a broad fissure in the peristome.

## Measurements (in mm):

shell height	maximum diameter	number of whorls	
14.7	29.5	4.3	lectotype
14.0	29.0	3.8	
14.6	30.0	4.3	
15.5	30.0	—	
16.0	30.5	4.5	
16.0	28.5	4.5	

Remarks. — This species differs from *Anostoma luetzelburgi* Weber in: (1) that the subsutural spiral colour band terminates on the penultimate whorl; (2) that the lamellae in the aperture are less curved and relatively smaller; (3) the less expanded peristome; (4) in the less spreading parietal callus; (5) in the broader fissure in the peristome.

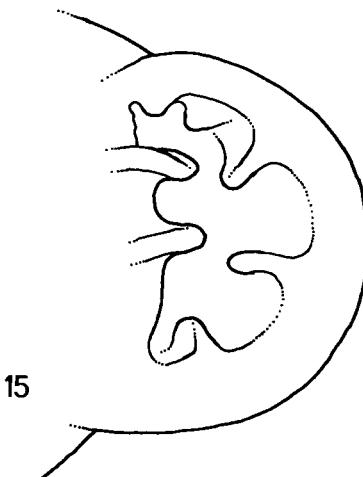

Fig. 15. *Anostoma rossi* Weber. Brazil, Goyas, Serra Geral/Bahia, S. Disiderio; lectotype, detail of aperture (München museum) (scale as in fig. 14).

## CATALOGUE

A catalogue of the Odontostominae has been published by Breure (1974a). The following taxa must be added: (all of these, except *ubajarensis*, are fossil):

- americana*, *Partula*, Heilprin, 1887: 115, fig. 60 ([Florida] Tampa Ballast Point, Hillsboro Bay, silex-bearing marl).  
*ballistae*, *Bulimulus (Hyperaulax)*, Dall, 1915: 26, pl. 1 fig. 15 (Florida, Tampa Bay, Ballast Point, Tampa silex bed) [HT USNM 165013].

- floridanus*, *Bulimulus*, Conrad, 1846: 399 (Florida, Tampa, Ballast Point, silex beds).
- heilprinianus*, *Bulimulus* (?*Anctus*), Dall, 1890: 6, pl. 1 figs. 6b, 10 ([Florida] Tampa Bay, Ballast Point) [HT USNM 111962].
- laxus*, *Bulimulus* (?*Anctus*) *americanus*, Dall, 1890: 7 ([Florida] Ballast Point) [HT USNM 111971].
- partulinus*, *Bulimulus* (?*Anctus*) *americanus*, Dall, 1890: 7 ([Florida] Ballast Point) [HT USNM 111970].
- remolina*, *Bulimulus* (*Hyperaulax*), Dall, 1915: 27, pl. 1 fig. 18 (Florida, Tampa Bay, Ballast Point, Tampa silex beds [HT USNM 165014]).
- staernsii*, *Bulimulus* (?*Anctus*), Dall, 1890: 7, pl. 1 fig. 12 ([Florida] Ballast Point) [HT USNM 111964].
- tampae*, *Bulimulus* (*Hyperaulax*), Dall, 1915: 26, pl. 1 fig. 3 (Florida, Tampa Bay, Ballast Point, Tampa silex beds) [HT USNM 165012].
- tortilla*, *Bulimulus* (*Hyperaulax*), Dall, 1915: 27, pl. 1. fig. 2 (Florida, Tampa Bay, Ballast Point, Tampa silex beds) [HT USNM 165015].
- ubajarensis*, *Tomigerus*, Leme, 1980: 356, figs. (Brazil, Ceara, Municipio de Ubajara, Parque Nacional de Ubajara) [HT DZSP 20001].
- wakullae*, *Bulimulus americanus*, Mansfield, 1937: 70 (Florida, near Wakulla, Tampa limestone).

## SUBFAMILY ORTHALICINAE

### SYSTEMATICS

#### **Sultana (Trachyorthalicus) augusti** (Jousseaume, 1887)

The holotype of this species has been located in the Muséum National d'Histoire Naturelle at Paris. The measurements of this specimen are: shell height 68.5 mm, diameter 38.0 mm, height of aperture 39.5 mm, width 23.5 mm, height of last whorl 54.5 mm; 5.7 whorls. The material is labelled "Équateur" (ex Cousin).

#### **Sultana (Metorthalicus) deburghiae** (Reeve, 1859)

A specimen preserved in the London museum has been designated lectotype by S. P. Dance: shell height 65.0 mm, diameter 33.5 mm (BMNH 19601622). The material is labelled "Banks of Amazon River" (ex Cuming).

Type material of the junior synonym *Bulimus gloriosus* Pfeiffer, 1862, is also present in the London museum. The lectotype designated measures: shell height 75.0 mm, diameter 38.5 mm (BMNH 1975243) and is labelled "Ecuador" (ex Cuming ex Fraser).

**Sultana (Metorthalicus) fraseri (Pfeiffer, 1858)**

A specimen of this species has been found in the British Museum (Natural History) and is designated lectotype: shell height 89.0 mm, diameter 46.0 mm (BMNH 1975246). It is labelled "Found on the road from Gualaquiza to Mendez — and near to the latter place", "Province of Cuenca, Republic of Ecuador" (ex Cuming ex Fraser).

**Sultana (Metorthalicus) kelletii (Reeve, 1850)**

The specimen corresponding to the original figure (Reeve, 1850: pl. 89 fig. 661), preserved in the London museum, is designated lectotype: shell height 60.5 mm, diameter 32.5 mm (BMNH 1975241). The material is labelled "? Ecuador" (ex Cuming).

**Sultana (Metorthalicus) yatesi (Pfeiffer, 1855)**

A lectotype is designated from among the type material that is preserved in the British Museum (Natural History). The measurements of this specimen are: shell height 84.0 mm, diameter 40.5 mm (BMNH 1975239). There are two paralectotypes and the material is labelled "Meobamba, East Peru" (ex Cuming).

**Sultana (Melaniorthalicus) powisianus (Petit, 1843)**

A syntype of this species has been found in the Paris museum. The measurements of this specimen are: shell height 73.5 mm, diameter 33.5 mm, height of aperture 30.0 mm, width 18.5 mm, height of last whorl 49.0 mm; 6.7 whorls. The material is labelled "Montagne de Quindiu" (ex Goudot).

**Orthalicus bensonii (Reeve, 1849)**

Three syntypes of this species are preserved in the British Museum (Natural History), of which one closely resembles Reeve's figure. The material is labelled "Brazil" (ex Cuming). The measurements are (in mm):

height	shell diameter	aperture		number of whorls
		height	width	
69.0	34.0	27.5	18.5	8.2
68.0	35.0	29.0	20.0	7.5
60.5	31.0	26.5	17.5	7.3

***Orthalicus bifulguratus* (Reeve, 1849)**

The specimen corresponding to the original figure (Reeve, 1849: pl. 82 fig. 606) is designated lectotype: shell height 57.0 mm, diameter 32.5 mm (BMNH 1975583). The specimen is labelled "Andes of Columbia" (ex Cuming).

***Orthalicus ferussaci* Martens, 1864**  
(fig. 16)

Genitalia. — Penis without a sheath, more or less subcylindrical. The transition between penis and epiphallus is marked by a swollen structure. Distal part of penis with an appendix, which is fan-shaped and has five short lobes. Flagellum subcylindrical, its distal part tapering; ca. 1/3 the length of the phallus; the retractor muscle is distally inserted. The vas deferens is relatively broad. The vagina is subcylindrical and broad, but tapering towards the genital atrium; ca. 2/5 the length of the phallus. Spermathecal duct subcylindrical, with a globose spermatheca at the distal end. Spermoviduct with some twistings in its proximal part.

Radula. — The teeth are monocuspids, with blunt spatula-shaped mesocones; in the outermost teeth with small, curved ectocones. The V-shaped transverse rows form an angle of 55 degrees with the central length row.

Material. — Mexico, Michoacan, El Espinal, 1600 feet (UF).

***Orthalicus maracaibensis* Pfeiffer, 1856**  
(fig. 17)

Genitalia. — Penis without a sheath, subcylindrical, its median part with a hand-shaped appendix. Proximal part of epiphallus swollen. The flagellum is subcylindrical and nearly half the length of the phallus; with a distally inserted retractor muscle. The vas deferens is relatively broad. Genital atrium broad and swollen, with separate ♂- and ♀-openings. The vagina is rela-

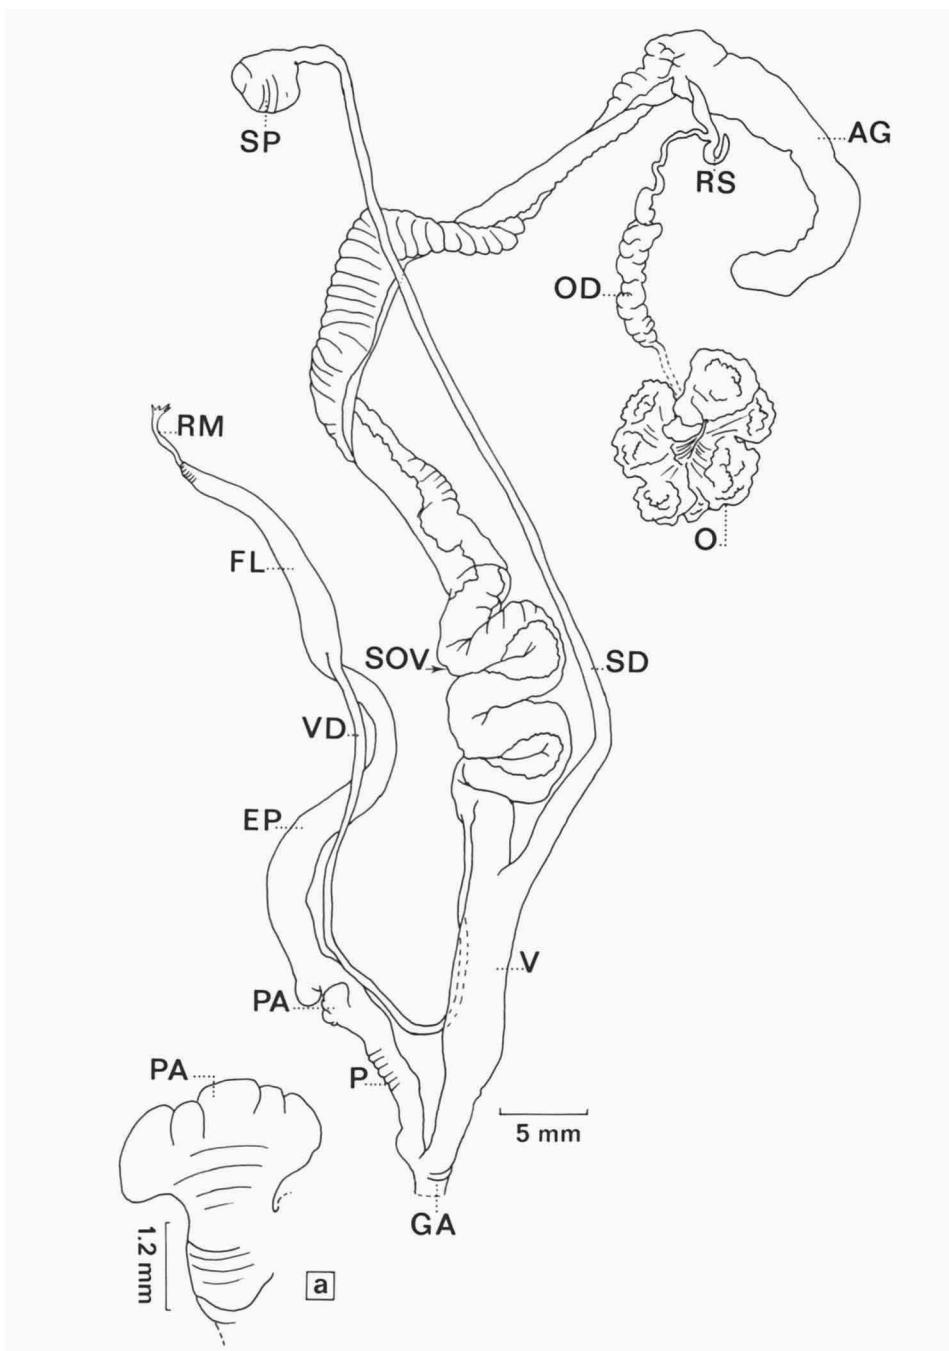

Fig. 16. *Orthalicus ferussaci* Martens, genitalia, with detail of PA (a). Mexico, El Espinal (UF).

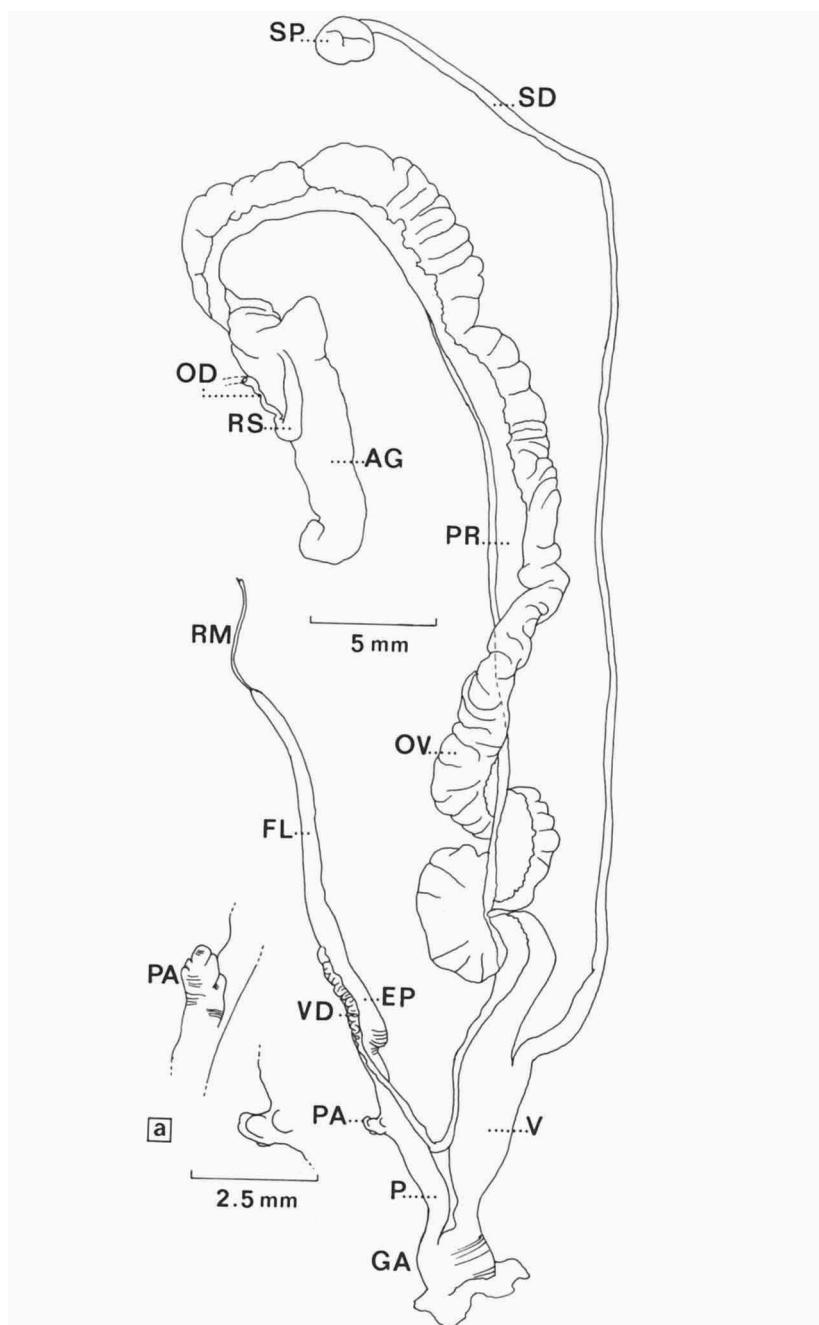

Fig. 17. *Orthalicus maracaibensis* (Pfeiffer), genitalia, with details of PA (a). Venezuela, Edo. Lara, 18 km W Barquisimeto (RMNH).

tively broad, tapering towards the genital atrium. The spermathecal duct is subcylindrical, with a small, globose spermatheca at the distal end.

Radula. — The teeth are monocuspisid, with blunt spatula-shaped mesocones. The V-shaped transverse rows form an angle of 50 degrees with the central length row.

Material. — Venezuela, Edo. Lara, 18 km W Barquisimeto (RMNH).

**Orthalicus melanocheilus** (Valenciennes, 1833)

(fig. 18)

Genitalia. — Penis without a sheath, subcylindrical, its distal part with a hand-shaped appendix. The transition between penis and epiphallus is marked by a swollen structure. Epiphallus and flagellum subcylindrical, both ca. 2/5 the length of the phallus; the flagellum with a distally inserted retractor muscle. The vagina is subcylindrical and broad, ca. 1/3 the length of the phallus. The spermathecal duct is more or less subcylindrical, with a globose spermatheca at the distal end. Proximal part of spermoviduct with twistings. Ovotestis with lobes.

Radula. — Central teeth moncuspid, with rather acute, lanceolate mesocones. The lateromarginal teeth are moncuspid, with blunt spatula-shaped mesocones (only the first lateral teeth with slightly acute mesocones). In some of the outermost teeth rudimentary ectocones have been observed. The V-shaped transverse rows form an angle of 70 degrees with the central length row.

Material. — Mexico, Guerrero, 19.3 miles W San Macros, 300 feet (UF).

**Orthalicus princeps** (Sowerby, 1833)

(fig. 19)

Genitalia. — Penis without a sheath, subcylindrical, its distal part with an appendix, which is made up by three lobes. Epiphallus and flagellum subcylindrical, both ca. 1/4 the length of the phallus; a retractor muscle is inserted at the distal end of the flagellum. The vagina is subcylindrical, its distal part twice as broad as the proximal part; ca. 1/3 the length of the phallus. The spermathecal duct is subcylindrical, with a globose spermatheca at the distal end.

Radula. — The teeth are moncuspid, with blunt, spatula-shaped mesocones; the outermost teeth bear a small, curved and acute ectocone. The

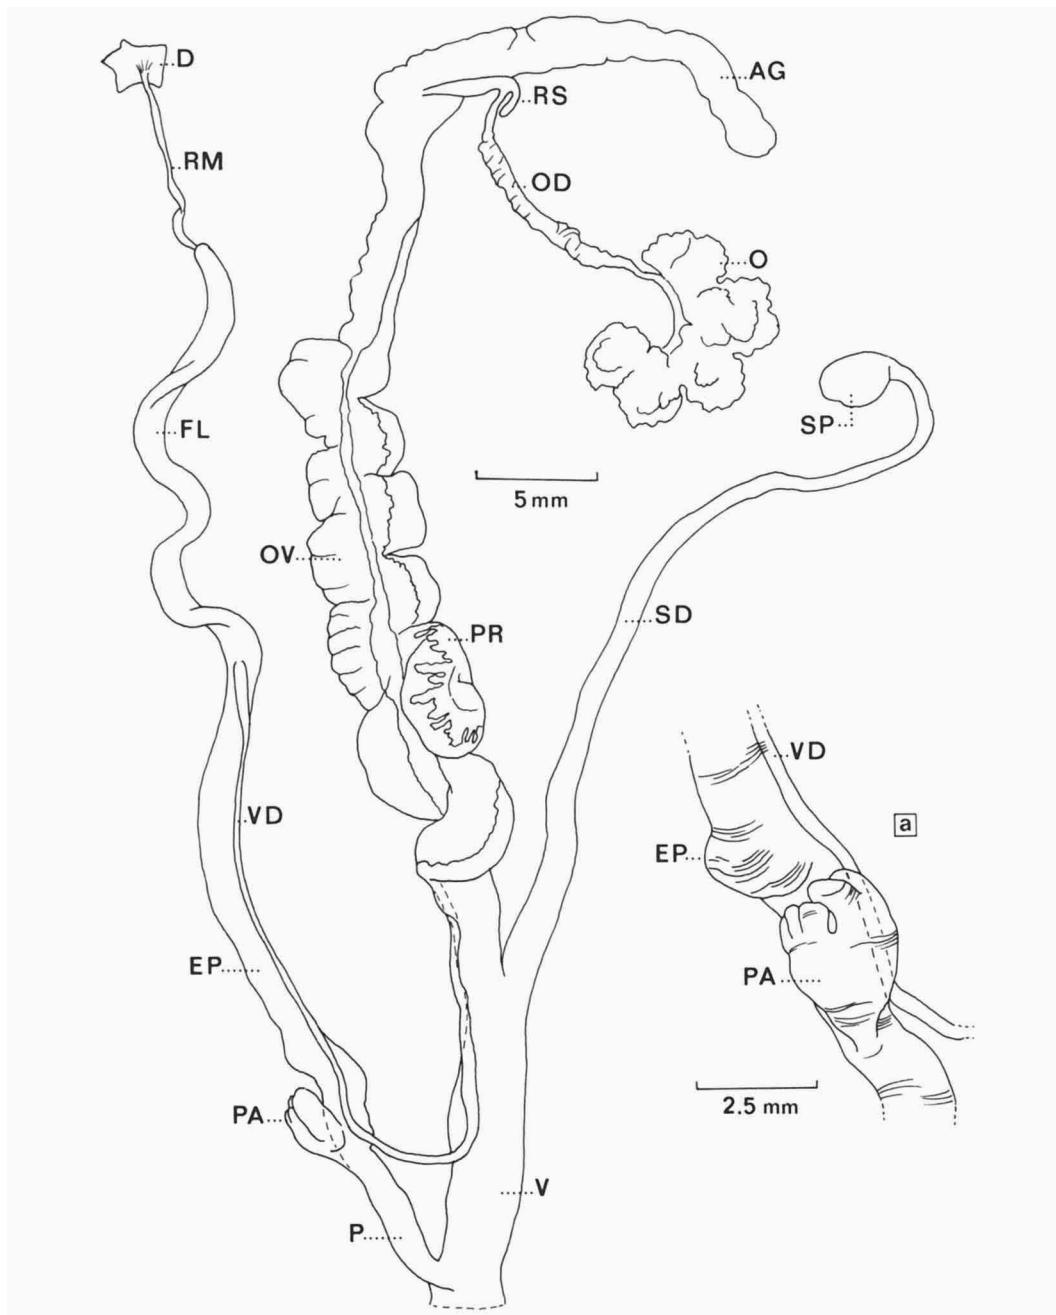

Fig. 18. *Orthalicus melanocheilus* (Valenciennes), genitalia, with detail of PA (a). Mexico, Quer-  
tero, 19.3 mi W San Marcos (UF).

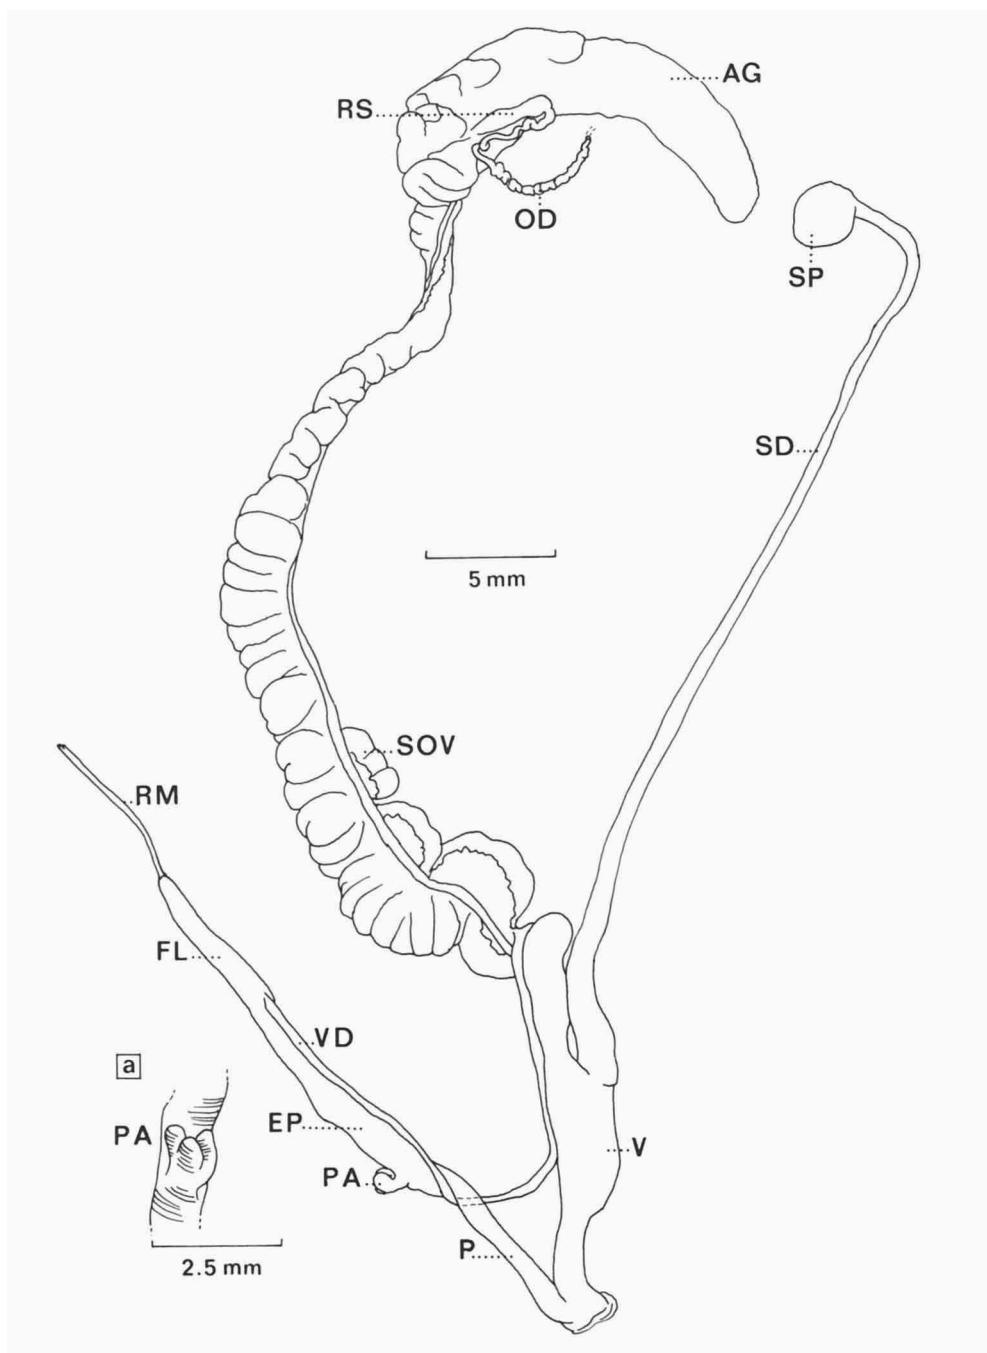

Fig. 19. *Orthalicus princeps* (Broderip), genitalia, with detail of PA(a). West Indies (RMNH).

transverse rows form an angle of 55 degrees with the central length row.

Material. — Mexico, Oaxaca, 3.4 mi WNW Zanatepec, ca. 275 feet (UF); West Indies (RMNH).

**Orthalicus undatus** (Bruguière, 1789)  
(fig. 20)

Genitalia. — Penis without a sheath, its proximal part swollen and bearing a lobed appendix. The distal part of the penis and the epiphallus are subcylindrical. The flagellum, which is ca. half the length of the phallus, is slightly tapering and has a distal retractor muscle. The vagina is relatively broad, ca. 1/3 the length of the phallus. The spermathecal duct is subcylindrical, with a globose spermatheca at the distal end.

Radula. — The teeth are monocuspids, with blunt, spatula-shaped mesocones; the outermost lateromarginal teeth with small, acute and curved ectocones. The transverse rows form an angle of 55 degrees with the central length row.

Material. — Trinidad, NE of Port-of-Spain, Petit Vallee (RMNH).

**Orthalicus zoniferus** Strebel & Pfeffer, 1882  
(fig. 21)

Genitalia. — Penis without a sheath, with a narrow proximal part and a relatively broad median and distal part; the median part with a tubercle-shaped appendix. Epiphallus and flagellum tapering, both ca. 1/3 the length of the phallus. The vagina is more or less subcylindrical; ca. 1/3 the length of the phallus. The spermiduct is subcylindrical, with a small, globose spermatheca at the distal end.

Radula. — The teeth are monocuspids, with blunt, spatula-shaped mesocones; the outer lateromarginal teeth with small, acute and curved ectocones. The transverse rows form an angle of 50 degrees with the central length row.

Material. — Mexico, Jalisco, hill 1.0 mi NW Zapotiltic (UF).

**Orthalicus spec. A**  
(fig. 22)

Genitalia. — Penis without sheath, subcylindrical and passing without ex-

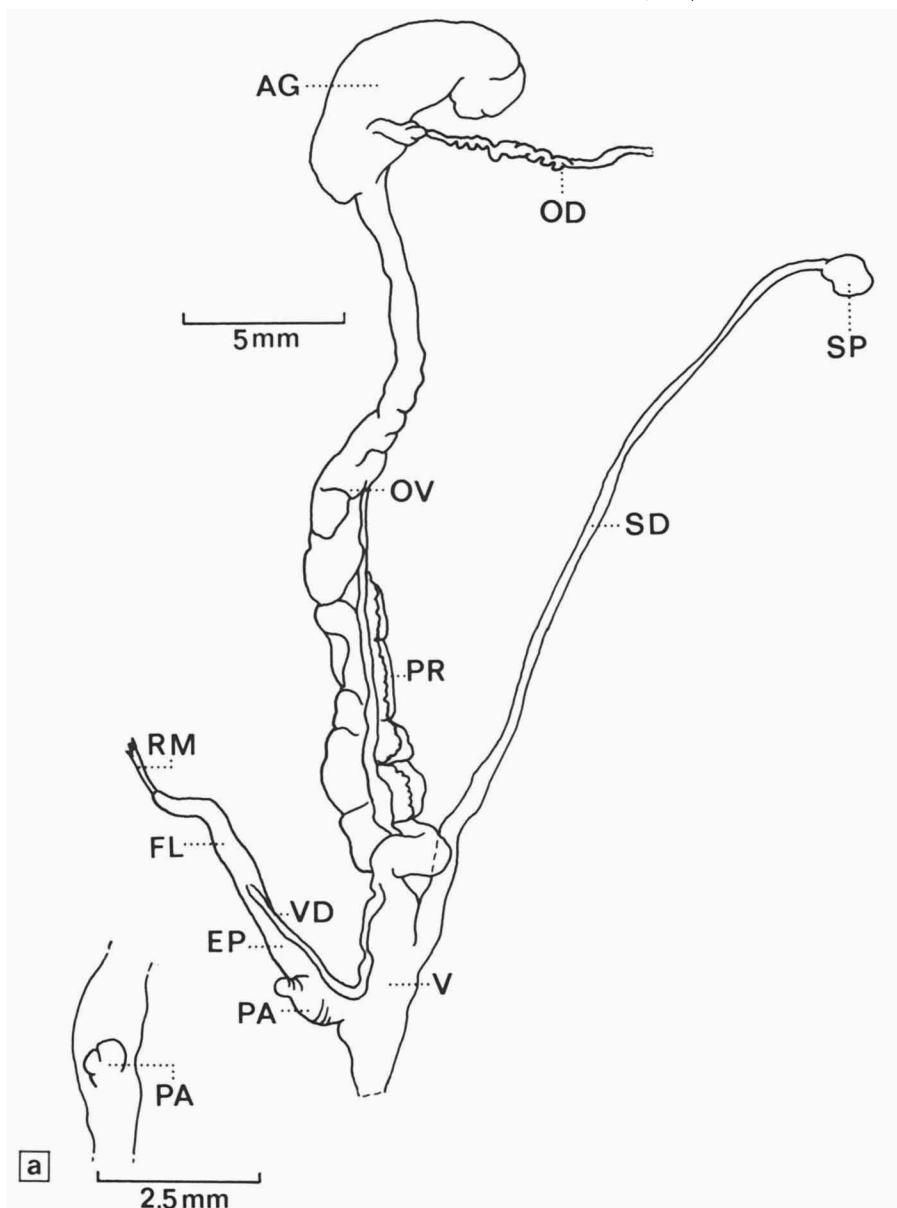

Fig. 20. *Orthalicus undatus* (Bruguière), genitalia, with detail of PA (a). Trinidad, NE Port of Spain, Petit Vallee (RMNH).

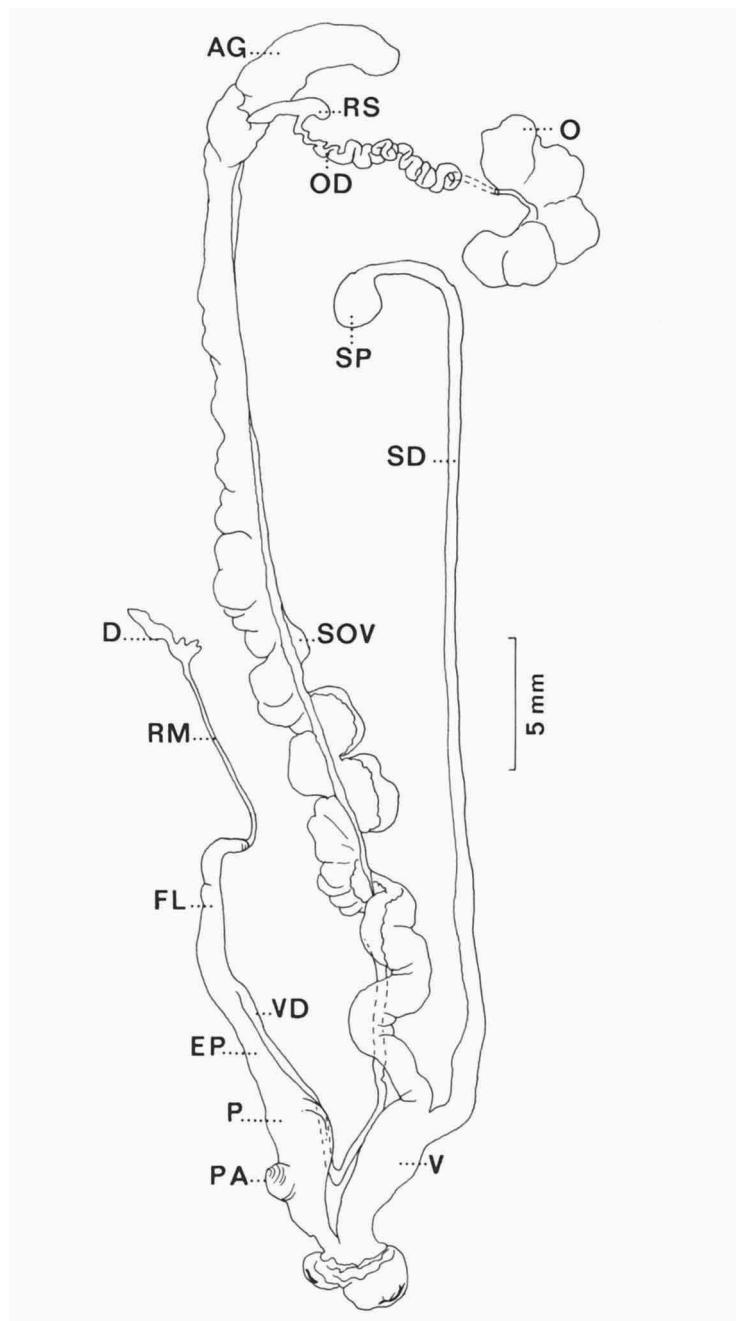

Fig. 21. *Orthalicus zoniferus* (Strebel & Pfeffer), genitalia. Mexico, Jalisco, 1 mi NW Zapotiltic (UF).

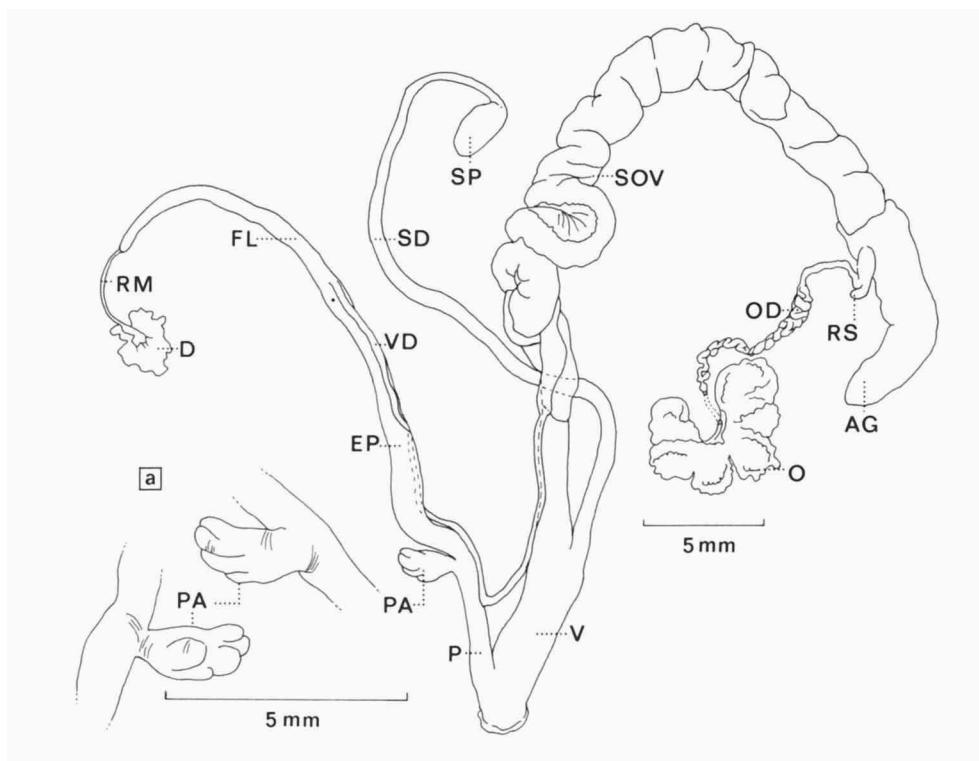

Fig. 22. *Orthalicus* spec. A, genitalia, with detail of PA (a). Mexico, Jalisco, 1 mi NW Zapotiltic (UF).

ternal differentiation into the epiphallus; with a hand-shaped appendix. Flagellum slightly tapering, ca. 1/3 the length of the phallus and with a distally inserted retractor muscle. The vagina is subcylindrical and broad, ca. 1/4 the length of the phallus. Spermathecal duct subcylindrical, with an elongate-globose spermatheca at the distal end. Proximal part of spermoviduct with some twistings. Ovotestis with lobes.

**Radula.** — The teeth are monocuspид, with blunt, spatula-shaped mesocones. The transverse rows form an angle of 50 degrees with the central length row.

**Material.** — Mexico, Jalisco, hill 1.0 mi NW Zapotiltic (UF).

***Orthalicus* spec. B**  
 (fig. 23)

**Genitalia.** — Penis without a sheath, subcylindrical and passing without external differentiation into the epiphallus; with a lobed appendix. The flagellum is tapering, ca. 1/3 the length of the phallus and with a distally inserted retractor muscle. Vagina relatively broad, ca. 2/5 the length of the phallus. Its proximal part constricted. Spermathecal duct subcylindrical, with a small elongate-globose spermatheca at the distal end.

**Radula.** — The teeth are monocuspis, with blunt, spatula-shaped mesocones; the marginal teeth with a small, acute ectocone. The transverse rows form an angle of 45 degrees with the central length row.

**Material.** — Mexico, Guerrero, 10.6 mi S Mexicala, ca. 2100 feet (UF).

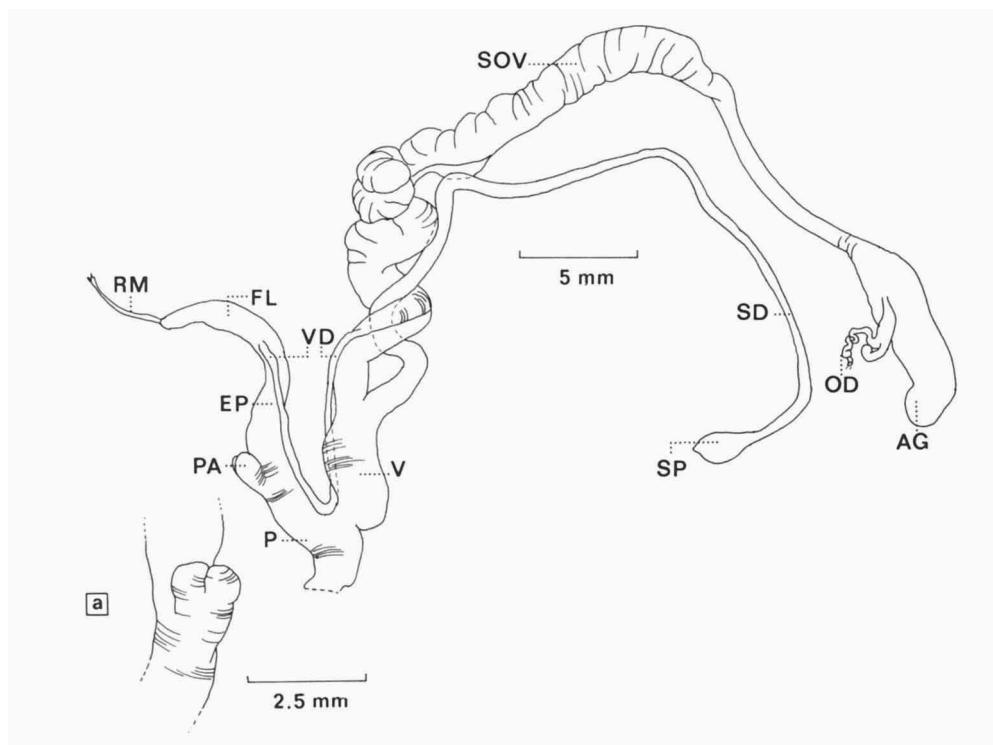

Fig. 23. *Orthalicus* spec. B, genitalia, with detail of PA (a). Mexico, Querrero, 10.6 mi S Mexicala (UF).

**Porphyrobaphe (Porphyrobaphe) iostoma (Sowerby, 1824)**  
 (fig. 24)

**Genitalia.** — Penis without a sheath, subcylindrical, passing without external differentiation into the epiphallus; with a stalked, elongate appendix. The flagellum is tapering and has a distally inserted retractor muscle; ca 1/5 the length of the phallus. The vagina is rather broad, about half the length of the phallus. The spermathecal duct is relatively short, subcylindrical and with an acutely globose spermatheca at the distal end.

**Radula.** — Central teeth monocuspид, with acute, wedge-shaped mesocones. The first two lateral teeth are monocuspид with acute, lanceolate mesocones. All other teeth are monocuspид with blunt, spatula-shaped mesocones;

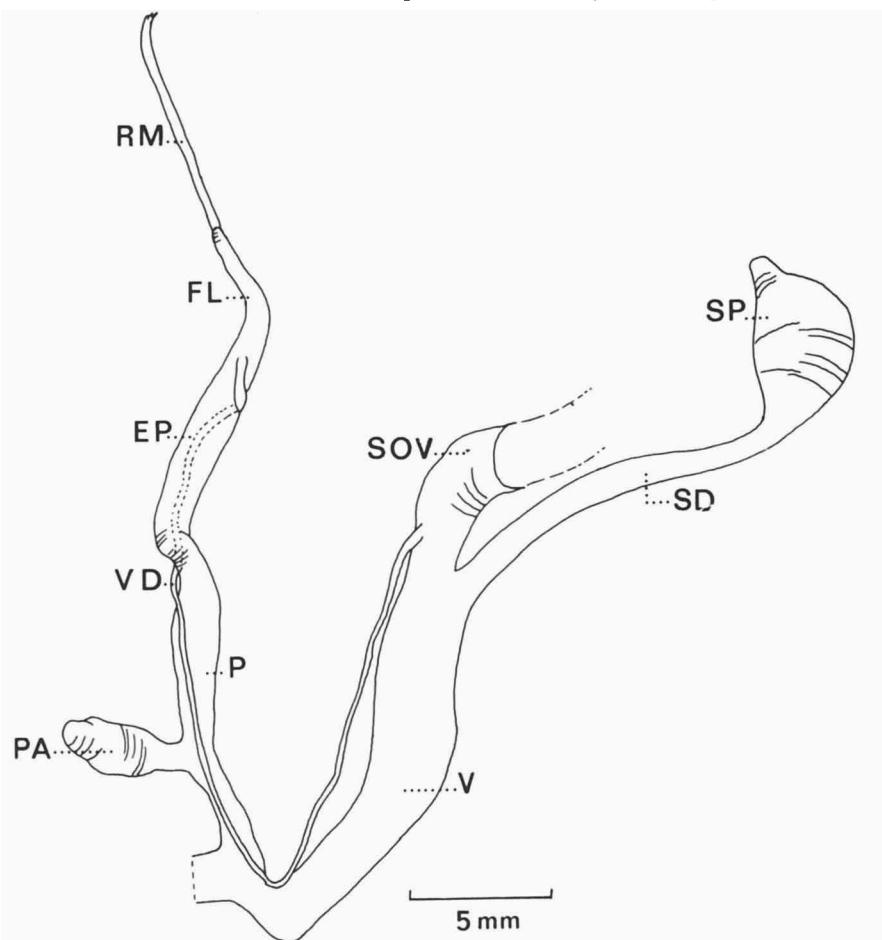

Fig. 24. *Porphyrobaphe (P.) iostoma* (Sowerby), genitalia. Ecuador, 31 mi N Santa Elena (UF).

the marginal teeth with a small, acute and curved ectocone. The transverse rows form an angle of 70 degrees with the central length row.

Material. — Ecuador, Prov. El Oro, 31 mi N of Santa Elena (UF).

**Porphyrobaphe (*Oxyorthalicus*) *iris* (Pfeiffer, 1853)**  
(figs. 25, 26)

Genitalia. — Penis without a sheath, more or less subcylindrical and passing without external differentiation into the epiphallus. Median part of the penis with an appendix, which has two tubercle-shaped lobes. The flagellum, which is ca. 1/3 the length of the phallus, is tapering; with a distally inserted retractor muscle. Vagina subcylindrical and broad, ca. 1/3 the length of the phallus. The spermathecal duct is relatively short, narrow and subcylindrical; the spermatheca is globose and relatively large.

Histology. — Proximal part of the penis with an irregularly shaped lumen, lined by low cylindrical epithelium. More distally an appendix is present with two parallel lumina. In one part of this appendix glandular cells, which stain dark-red with Haemalum-Eosin, have been observed in the subepithelial tissue. In the distal part of the penis, the lumen splits off blind-ending branches. The main lumen is more or less star-shaped with a gradual transition to the epiphallus, where the lumen is also star-shaped. Epithelium of the epiphallus is low cylindrical; the subepithelial tissue with glandular cells staining light blue with Alcian Blue. Parallel to the main lumen of the proximal part of the epiphallus a number of blind-ending tubes are observed, which are lined by flat cells bearing long cilia.

Radula. — Central teeth monocuspид, with acute triangular mesocones. The first four lateral teeth with monocuspид, more or less acute, triangular mesocones. Other teeth mono- to dicuspид, with blunt truncate to spatula-shaped mesocones and acute, curved and elongate ectocones in the outermost teeth. The transverse rows form an angle of 75 degrees with the length axis, but the outermost teeth are perpendicular to this axis.

Material. — Colombia, Depto. Caldas, Laguneta (NRS 2748).

**Porphyrobaphe (*Oxyorthalicus*) *irrorata* (Reeve, 1849)**  
(fig. 27)

Type specimens of this species are preserved in the London museum and one specimen is designated lectotype: shell height 77.0 mm, diameter 44.0 mm (BMNH 1975248). The material, which includes two paralectotypes, is labelled "Quito" (ex Cuming).

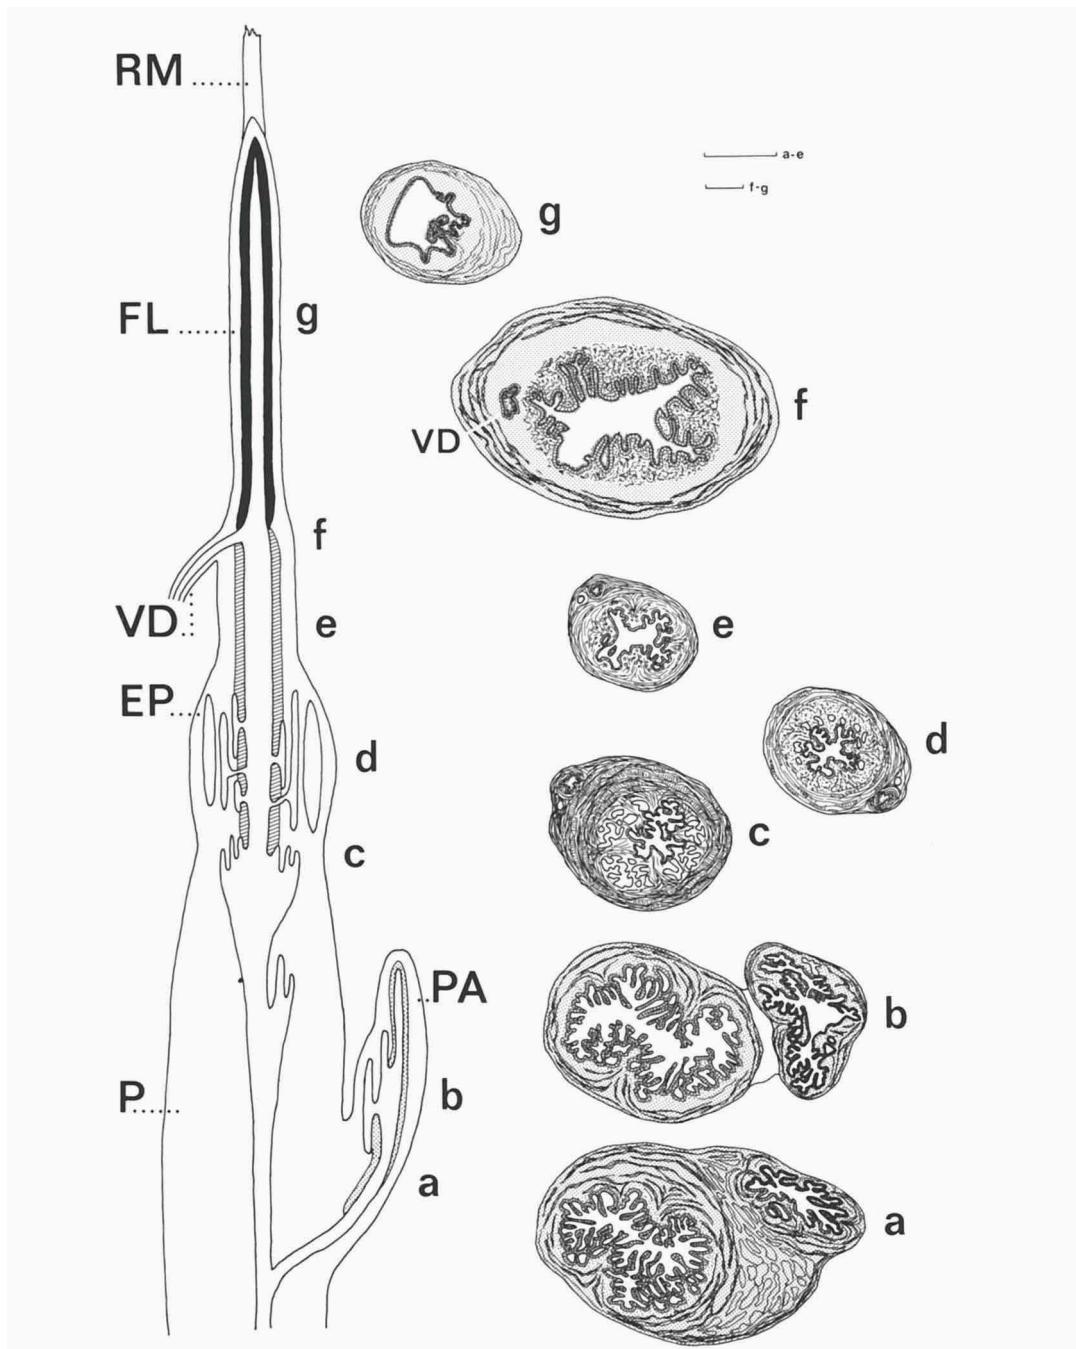

Fig. 26. *Porphyrobaphe (Oxyorthalicus) iris* (Pfeiffer). Colombia, Laguneta. Schematic reconstruction of penial complex and transverse sections of penis (a-c), epiphallus (c-f) and flagellum (g). Scale lines equal 1 mm.

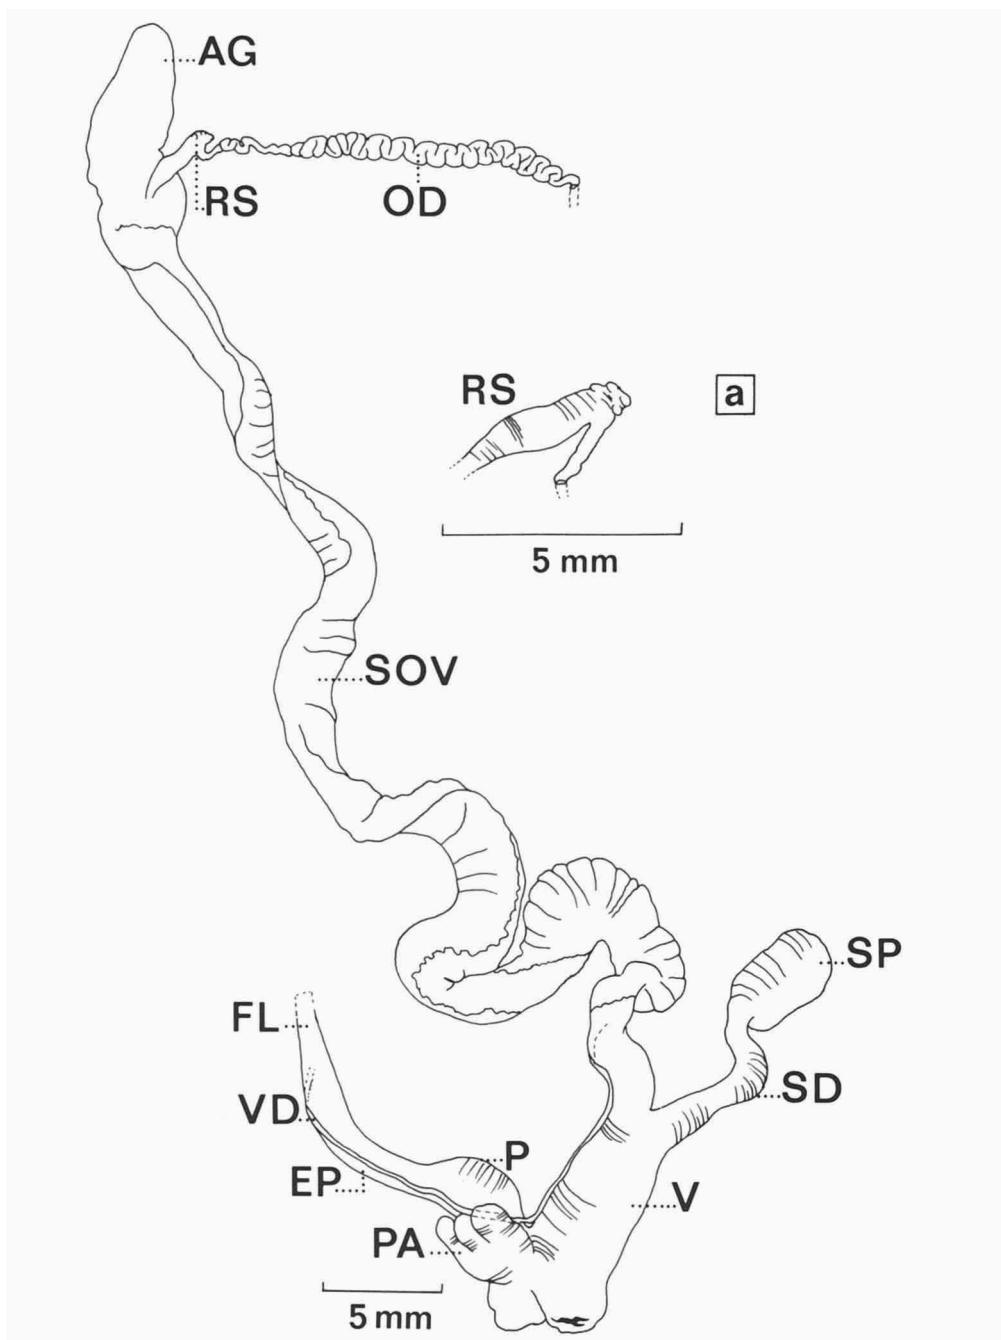

Fig. 27. *Porphyrobaphe (Oxyorthalicus) irroratus* (Reeve), genitalia, with detail of RS (a). Colombia, Valle, Cisneros (NRS).

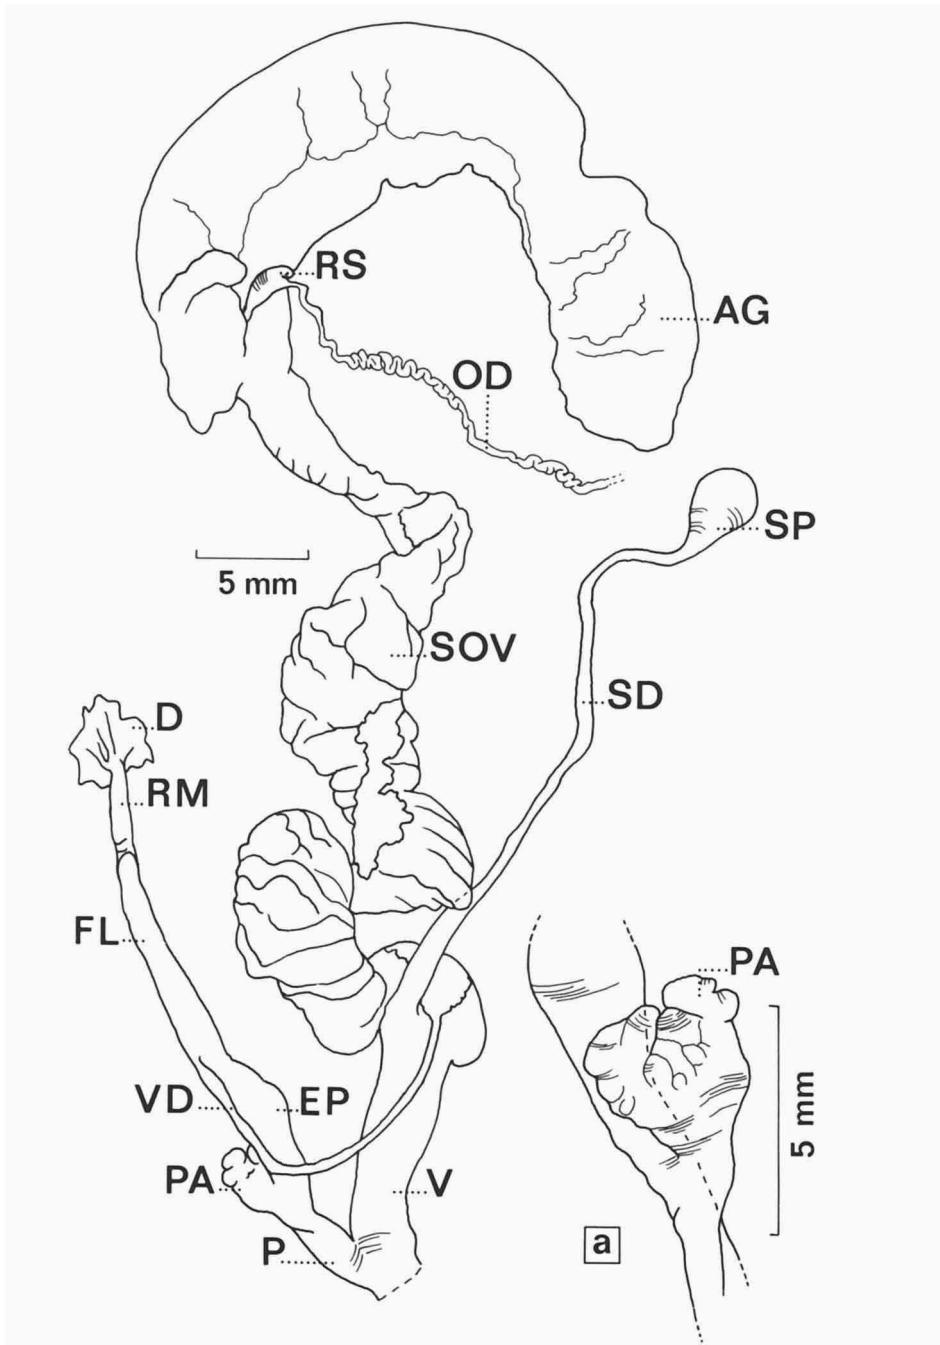

Fig. 28. *Ligia fasciata* (Muller), genitalia, with detail of PA (a). USA, Florida, Everglades National Park, Anlimga trail (RMNH).

**Hemibulimus (Myiorthalicus) dennisoni** (Reeve, 1848)

Two syntypes of this species are preserved in the London museum. Their measurements (in mm) are:

shell		aperture		number of
height	diameter	height	width	whorls
71.0	36.5	35.0	22.0	6.0
70.0	34.5	33.0	19.5	6.0

**Liguus fasciatus** (Müller, 1774)

(fig. 28)

Genitalia. — Penis without sheath, more or less subcylindrical and passing without external differentiation into the epiphallus; with a fan-shaped appendix. Epiphallus and flagellum tapering; the flagellum is about half the length of the phallus and has a distally inserted retractor muscle. The vagina is subcylindrical and broad, about half as long as the phallus. Spermathecal duct more or less subcylindrical, with a small elongate-globose spermatheca at the distal end.

Radula. — Central and first four lateral teeth monocuspид, with rather acute wedge-shaped mesocones. Other teeth (di- to) monocuspид, with blunt spatula-shaped mesocones (and small elongate ectocones). The transverse rows form an angle of 50 degrees with the length axis.

Material. — U.S.A., Florida, Everglades National Park, Anhinga Trail (RMNH).

*zoniferus*, *Zebra boucardi*, Streb., 1909: 75, pl. 14 figs. 224, 225 ([Mexico] Tehuantepec).

## SUBFAMILY PLACOSTYLINAE

### SYSTEMATICS

#### **Placostylus (Maoristylus) ambagiosus keenorum Powell, 1947** (fig. 29)

Genitalia. — Penis subcylindrical, passing without external differentiation into the epiphallus. The flagellum is ca. 1/6 the length of the phallus. Spermathecal duct subcylindrical, bearing an elongate-globose spermatheca.

Material. — New Zealand, Northland, Spirits Bay (NMW).

#### **Placostylus (Maoristylus) bivaricosus cuniculinsulae (Cox, 1872)**

The type material of this taxon is present in the British Museum (N.H.) and is labelled "Rabbit Is. near Lord Howe's Is." (ex Cox). One specimen is here designated lectotype: shell height 42.0 mm, diameter 20.5 mm (BMNH 1880.12.11.47).

Redescription. — Shell perforate, with slightly convex sides, rather thin. Colour yellowish brown with darker brown axial streaks. Surface slightly shining, with the growthlines irregularly thickened. Protoconch with irregular oblong pits. Whorls slightly convex; suture well impressed. Aperture subovate, brownish-blueish coloured inside. Peristome slightly thickened, simple, orange coloured. Columellar margin hardly reflexed and somewhat dilated, orange inside.

#### **Placostylus (Maoristylus) shongi (Lesson, 1826)** (fig. 30)

Genitalia. — Penis subcylindrical, relatively thick, swollen at the transition to the epiphallus. The flagellum, which is slightly swollen, is ca. 1/5 the length of the phallus. The vagina is relatively short. The spermathecal duct is sub-

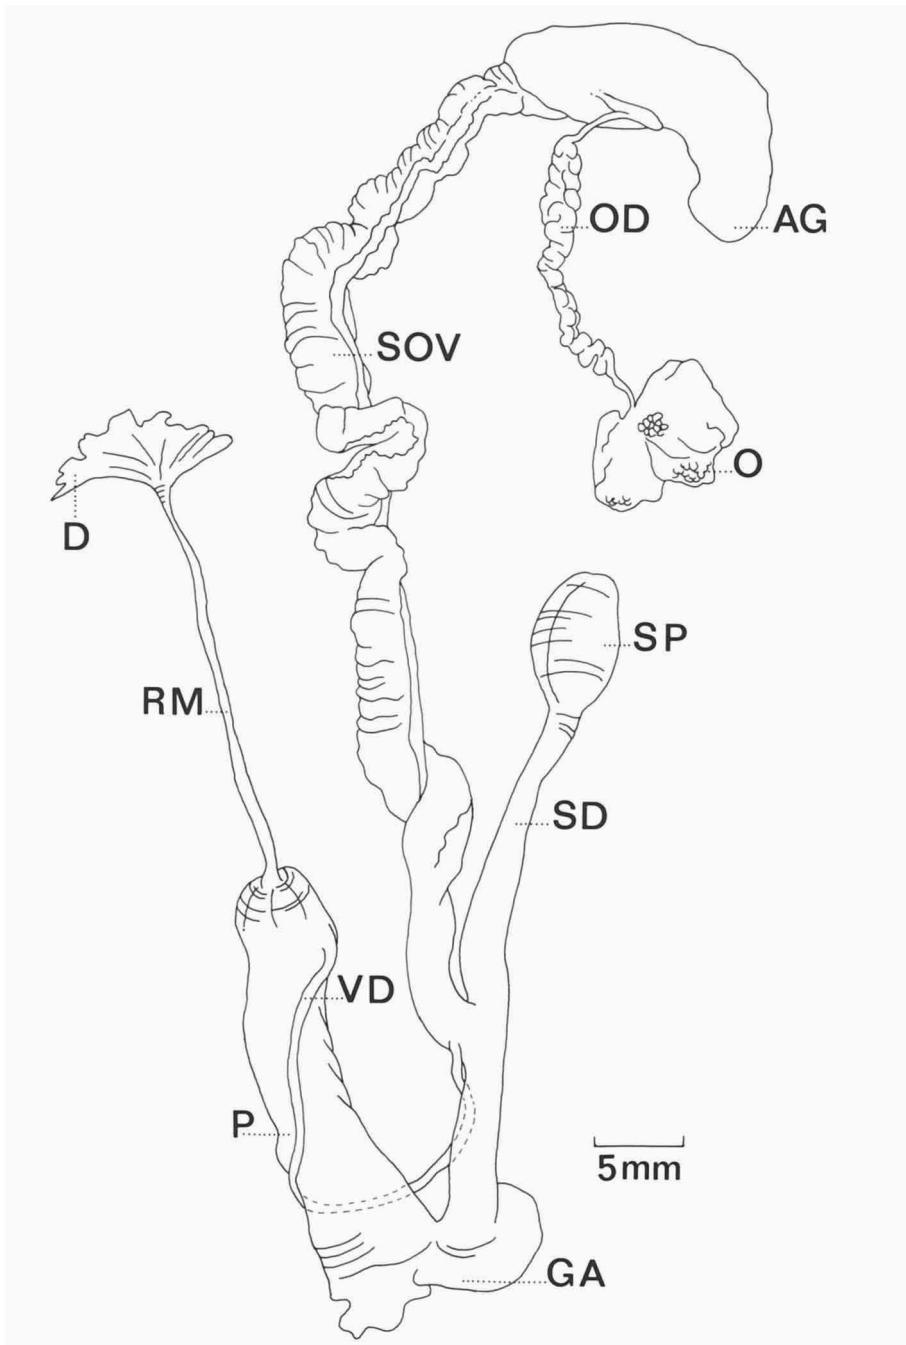

Fig. 29. *Placostylus (Maoristylus) ambagiosus keenorum* Powell, genitalia. New Zealand, Northland, Spirits Bay (NMW).

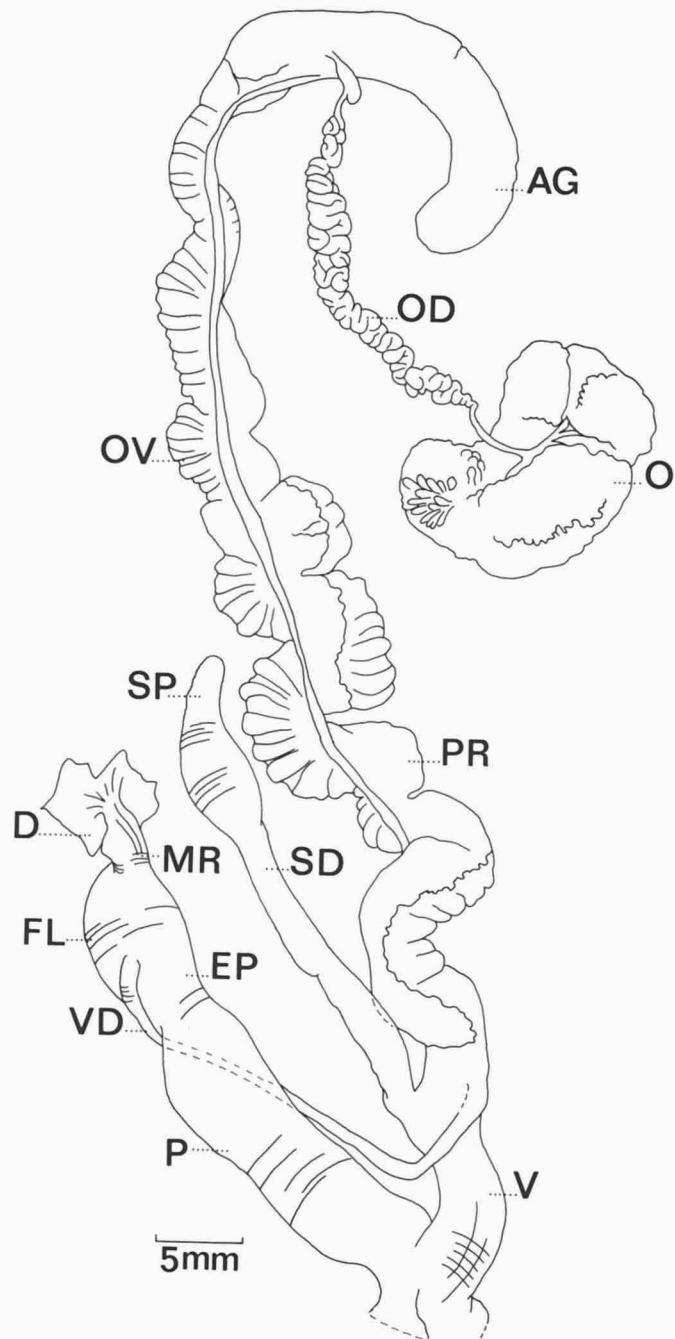

Fig. 30. *Placostylus (Maoristylus) shongii* (Lesson), genitalia. New Zealand, Northland, Whangaruru (NMW).

cylindrical, ca. 1/3 the length of the spermiduct; the spermatheca is elongate.

Material. — New Zealand, Northland, Whangaruru (NMW).

#### **Placostylus (Santacharis) salomonis (Pfeiffer, 1853)**

A type specimen of this species is present in the London museum and here designated lectotype: shell height 33.5 mm, diameter 20.5 mm (BMNH 1975234). It is labelled "New Hebrides" (ex Cuming).

*Bulimus pyrostomus* Pfeiffer, 1860, is considered a junior synonym of *B. salomonis* (see Pilsbry, 1900: 70). From among the type specimens preserved in the London museum one specimen is now designated lectotype: shell height 41.5 mm, diameter 22.0 mm (BMNH 1975235). The material is labelled "I. of Eurmanga New Hebrides" [sic, Erromanga] (ex Cuming).

#### **Placostylus (Santacharis) fuligineus (Pfeiffer, 1852)**

The type material of this species is preserved in the London museum and labelled "Aneiteum". One specimen is here designated lectotype: shell height 39.0 mm, diameter 21.0 mm (BMNH 1975226). Two paralectotypes are registered 1975227. Specimens of the variety described by Pfeiffer (1859: 363) are also present in the same collection (BMNH 1975228/229).

#### **Placostylus (Placostylus) eddystonensis (Pfeiffer, 1855)**

A lectotype is here designated from among the type material present in the British Museum (N.H.): shell height 73.5 mm, diameter 36.5 mm (BMNH 1975230). There are two paralectotypes (BMNH 1975231) and the material is labelled "Eddystone Isld, Australian Sea" (ex Cuming).

#### **Placostylus (Placostylus) falcicula (Gassies, 1871)**

A specimen without locality label but originating from the collection of Gassies is preserved in the London museum and considered a syntype (BMNH 1883.11.10.1174). Its measurements are: shell height 74.5 mm, diameter 36.0 mm.

**Placostylus (Placostylus) fibratus (Martyn, 1784)**

In the London museum type material has been located of the following junior subjective synonyms:

*Bulimus bairdii* Reeve, 1848

The specimen corresponds to Reeve (1848: pl. 43 fig. 272) and is here designated lectotype: shell height 78.0 mm, diameter 34.5 mm (BMNH 1975223).

*Bulimus edwardsianus* Gassies, 1863

One specimen, labelled "Nekété" (ex Gassies ex Marie), is considered a syntype (BMNH 1883.11.10.1172).

*Bulimus fibratus grammica* Crosse, 1870

A specimen originating from the Crosse-collection and collected by Marie is labelled "type de l'auteur", without indication of the locality. The measurements of the specimen are: shell height 112.0 mm, diameter 51.5 mm (BMNH 1929.9.14.5). It is considered a syntype.

*Bulimus infundibulum* Gassies, 1878

One specimen originating from the collection of Gassies and without locality label is here considered a syntype: shell height 75.5 mm, diameter 46.0 mm (BMNH 1883.11.10.1163).

*Bulimus necouensis* Gassies, 1878

A specimen from the Gassies-collection without indication of the locality is considered a syntype. The shell height is 74.0 mm, the diameter 33.0 mm (BMNH 1883.11.10.1175).

*Bulimus ouensis* Gassies, 1870

Under number BMNH 1883.11.10.1167 a syntype is preserved without locality label. The measurements are: shell height 84.0 mm, diameter 39.5 mm (ex Gassies).

*Bulimus pinicola* Gassies, 1870

One specimen, which originates from the collection of Gassies, is preserved without locality label. The measurements are: shell height 93.0 mm, diameter 44.0 mm (BMNH 1883.11.10.1164). The label reads "B. pinicula" (sic).

*Bulimus senilis* Gassies, 1869

A specimen without indication of the locality measures: shell height 127.0 mm, diameter 62.0 mm (BMNH 1883.11.10.1179; ex Gassies).

*Bulimus superfasciatus* Gassies, 1878

One specimen without locality label is considered a syntype. The measurements are: shell height 77.0 mm, diameter 39.5 mm (BMNH 1883.11.10.1165; ex Gassies).

**Placostylus (Placostylus) guestieri** Gassies, 1869

Type material of the junior subjective synonym *Bulimus souvillei gatopensis* Crosse, 1870, has been found in the British Museum (N.H.). The single specimen, which is considered a syntype, has been collected by Marie but is not accompanied by a locality label. The measurements are: shell height 94.5 mm, diameter 55.0 mm (BMNH 1929.9.14.4).

**Placostylus (Placostylus) ouveanus** (Mousson, 1869)

Type specimens of the following junior subjective synonyms are present in the London museum:

*Bulimus aesoepus* Gassies, 1871

One specimen, considered a syntype, without locality label. The measurements are: shell height 50.0 mm, diameter 35.5 mm (BMNH 1883.11.10.1173).

*Bulimus ouveanus alba* Crosse, 1874

One specimen, which may probably be considered the holotype, was collected by Marie at "Siandé". Measurements are: shell height 48.0 mm, diameter 24.5 mm (BMNH 1929.9.14.6).

*Bulimus ouveanus sinistrorsa* Crosse, 1884

One specimen, collected by Marie at "Lifu", may probably be considered the holotype. The measurements are: shell height 49.5 mm, diameter 27.0 mm (BMNH 1929.9.14.8).

**Placostylus (Placostylus) porphyrostomus** (Pfeiffer, 1853)

(fig. 31)

The holotype of *Bulimus singularis* Morelet, 1857 — a junior subjective synonym of *Placostylus porphyrostomus* — has been traced in the London museum (BMNH 1893.2.4.1530). The measurements of the specimen are: shell height 70.0 mm, diameter 40.5 mm. The material is labelled "Nlle Calédonie".

Genitalia. — Penis without a sheath, broadly subcylindrical, its proximal part relatively slender; passing without external differentiation into the epiphallus, which is subcylindrical and slightly more slender than the penis. Flagellum absent. The retractor muscle, which is distally inserted, is short and relatively broad. The vagina is tapering towards the genital atrium; ca. 1/4 the length of the phallus complex. The spermathecal duct is subcylindrical, its

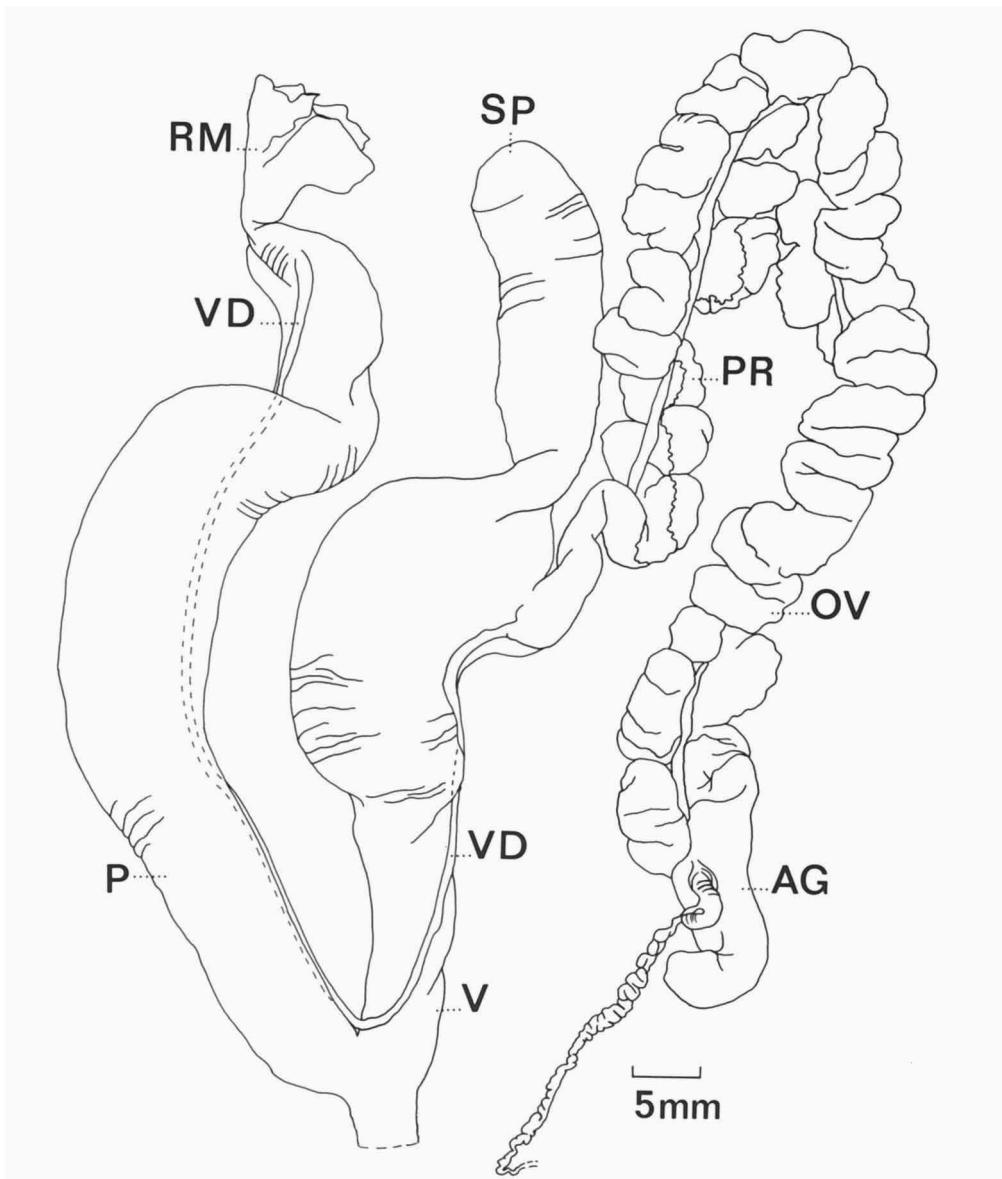

Fig. 31. *Placostylus (P.) porphyrostomus* (Pfeiffer), genitalia. New Caledonia (MNHN).

proximal part about two times as broad as its distal part; about half as long as the spermiduct. The spermatheca is not clearly demarcated.

Radula. — Central teeth tricuspid, with ovate mesocones and hardly differentiated ectocones. Lateromarginal teeth are dicuspid, with elongate to

lanceolate mesocones and elongate ectocones. The transverse rows are perpendicular to the central length row.

Material. — New Caledonia (MNHN).

**Placostylus (Placostylus) savesi (Crosse, 1886)**

One specimen of this taxon originating from the Crosse-collection is present in the London museum. The measurements are: shell height 57.5 mm, diameter 30.0 mm (BMNH 1929.9.14.7). The specimen was collected by Marie at "Pouembon (N.Cie)" and is here considered a syntype.

**Placostylus (Placostylus) souvillei (Morelet, 1857)**

The original material, labelled "Ste Marie de Balade, Nlle Calédonie", was found in the British Museum (Natural History). The specimen is here designated lectotype: shell height 117.5 mm, diameter 70.0 mm (BMNH 1893.2.4.1529).

**Placostylus (Placocharis) calus (E. A. Smith, 1891)**

Type material of this species is preserved in the London museum. One specimen is designated lectotype: shell height 78.5 mm, diameter 32.5 mm (BMNH 1891.11.3.4). The type material, which also includes two paralectotypes (1891.11.3.5-6), is labelled "Solomon Is." (ex Brazier).

**Placostylus (Placocharis) guppyi (E. A. Smith, 1891)**

Two type specimens of this taxon are present in the British Museum (N.H.). One of these specimens is here designated lectotype: shell height 80.5 mm, diameter 41.0 mm (BMNH 1891.11.6.110). The material is labelled "Solomon Is." (ex Brazier).

**Placostylus (Placocharis) macgillivrayi (Pfeiffer, 1855)**

In the London museum type material of this taxon has been located. One

specimen is here designated lectotype: shell height 58.5 mm, diameter 24.5 mm (BMNH 1975232). The material, which includes two paratypes, is labelled "Wanderer Bay, Guadacalnar, Solomons Islds" (ex Cuming ex Macgillivray).

**Placostylus (?Proaspastus) cylindricus (Fulton, 1907)**

The specimen corresponding to the figure of Fulton (1907: pl. 10 fig. 3), is present in the London museum and is considered holotype. The measurements of the specimen are: shell height 71.5 mm, diameter 24.0 mm (BMNH 1907.5.3.160). The material is labelled "Isabel Id., Solomon Ids".

**Aspastus (Callistocharis) subroseus (Fulton, 1915)**

The specimen figured by Fulton (1915: fig.) has been found in the British Museum (N.H.) and is here considered holotype: shell height 44.0 mm, diameter 21.0 mm. The label accompanying this specimen reads: "Viti Ids" [Fiji Islands] (ex Sowerby & Fulton ex Godefroy Museum).

**Aspastus (Poecilocharis) turneri (Pfeiffer, 1860)**

The specimen figured by Pfeiffer (1860: pl. 51 fig. 10) is preserved in the London museum and is considered the holotype. See also Solem, 1959: 137. The measurements of the type specimen are: shell height 33.0 mm, diameter 19.0 mm (BMNH 1975237). The material comprises two paratypes (BMNH 1975238) and is labelled "Euramanga [Erromanga], New Hebrides" (ex Turner).

**Diplomorpha (Quiros) bernieri (Hartman, 1890)**  
(fig. 32)

Genitalia. — Penis with a sheath, tapering towards the genital atrium; more or less subcylindrical and passing without external differentiation into the epiphallus, which is slightly more slender. The flagellum is ca. 1/4 the length of the phallus, with a distal retractor muscle. The spermathecal duct is subcylindrical and relatively short (ca. 1/3 the length of the spermoviduct).

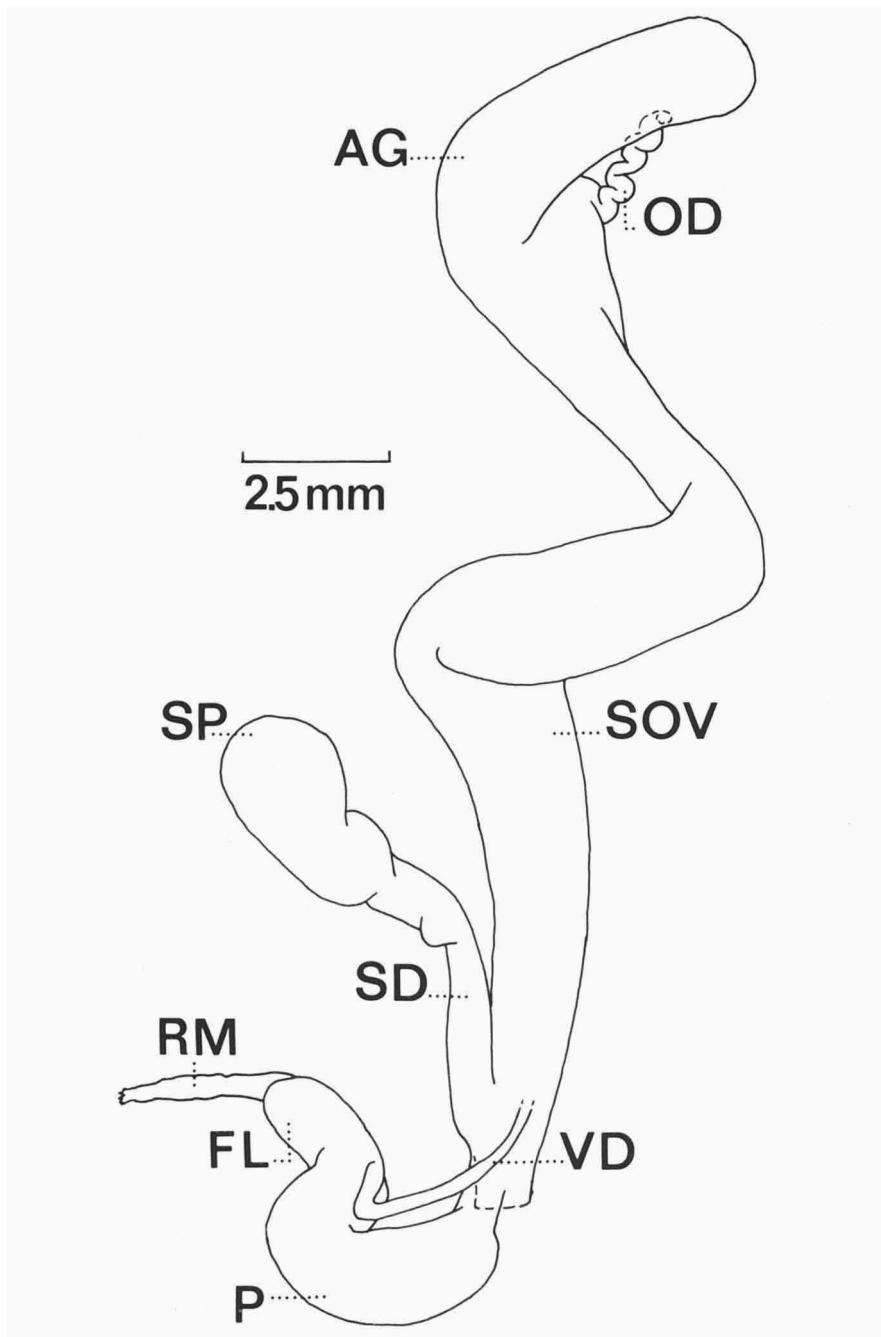

Fig. 32. *Diplomorpha (Quiros) bernieri* (Hartman), genitalia. New Hebrides (BMNH).

The spermatheca is elongate-globose. The vagina is very short.

Material. — New Hebrides (BMNH).

### Diplomorpha (Diplomorpha) delatouri (Hartman, 1886)

Genitalia. — Penis without a sheath, subcylindrical, with a slight (internal) constriction at the transition to the epiphallus. The vas deferens enters the phallus distally, where also a retractor muscle is inserted. The spermathecal duct is relatively short (ca. 1/3 the length of the spermoviduct), bearing a club-shaped spermatheca.

Material. — New Hebrides (BMNH).

### CATALOGUE

- abbreviata*, *Bulimus porphyrostomus*, Gassies, 1871: 77 ([New Caledonia] le Sud, depuis Bourail . . . jusqu'à Goro).

## APPENDIX 1

## Mandibulae

The mandibulae of 28 species were examined and compared with data (i.e. descriptions and figures) in the literature.

Three major types are distinguished (group A, B and C), which correspond respectively to the subfamilies Orthalicinae, Odontostominae and Placostylinae.

Group A  
(figs. 33d, e; pls. 2, 3)

The number of plates on each side of the central plate is 5-11 (average: 7.5). The most anterior plate is the central one: small, triangular, with two "cut-off" angles on the dorsal side and not reaching the ventral edge of the mandibula. Lateral plates are dorsally broad and narrowing towards the central plate, each plate largely overlapping the next one. The free edges of the lateral plates are somewhat curved and running parallel from ventral to dorso-lateral up to 2/3 of the width of the mandibula, and from there parallel to the central plate until the dorsal edge of the mandibula. The lateral plates are narrowing towards the median plate and tapering at the lateral sides.

At a magnification of 250 $\times$  the surface of the plates show a fine granulation; internally (a pattern of ) "cells", and on the free edges hair-like structures are visible (pl. 3 fig. 3). These structures were examined more closely in the mandibula of *Orthalicus zebra* (pl. 2 fig. 1 and pl. 3), using a Scanning Electron Microscope. The plates consist of "pillars" which lie close to each other in the same direction, i.e. perpendicular to the surface of each plate (pl. 2 figs. 2, 5, 6; pl. 3 figs. 1, 2). At the dorsal side of the mandibula the plates are less thick and are fused (pl. 2 figs. 3, 4; pl. 3 figs. 3-5). The surface of the plates is at greater magnification composed of smooth material (artefact?) and irregular interwoven "threads" (pl. 2 figs. 5, 6; pl. 3 figs. 5, 6). These "threads" are forming the fine granulation as seen through a light microscope (magnification 250 $\times$ ).

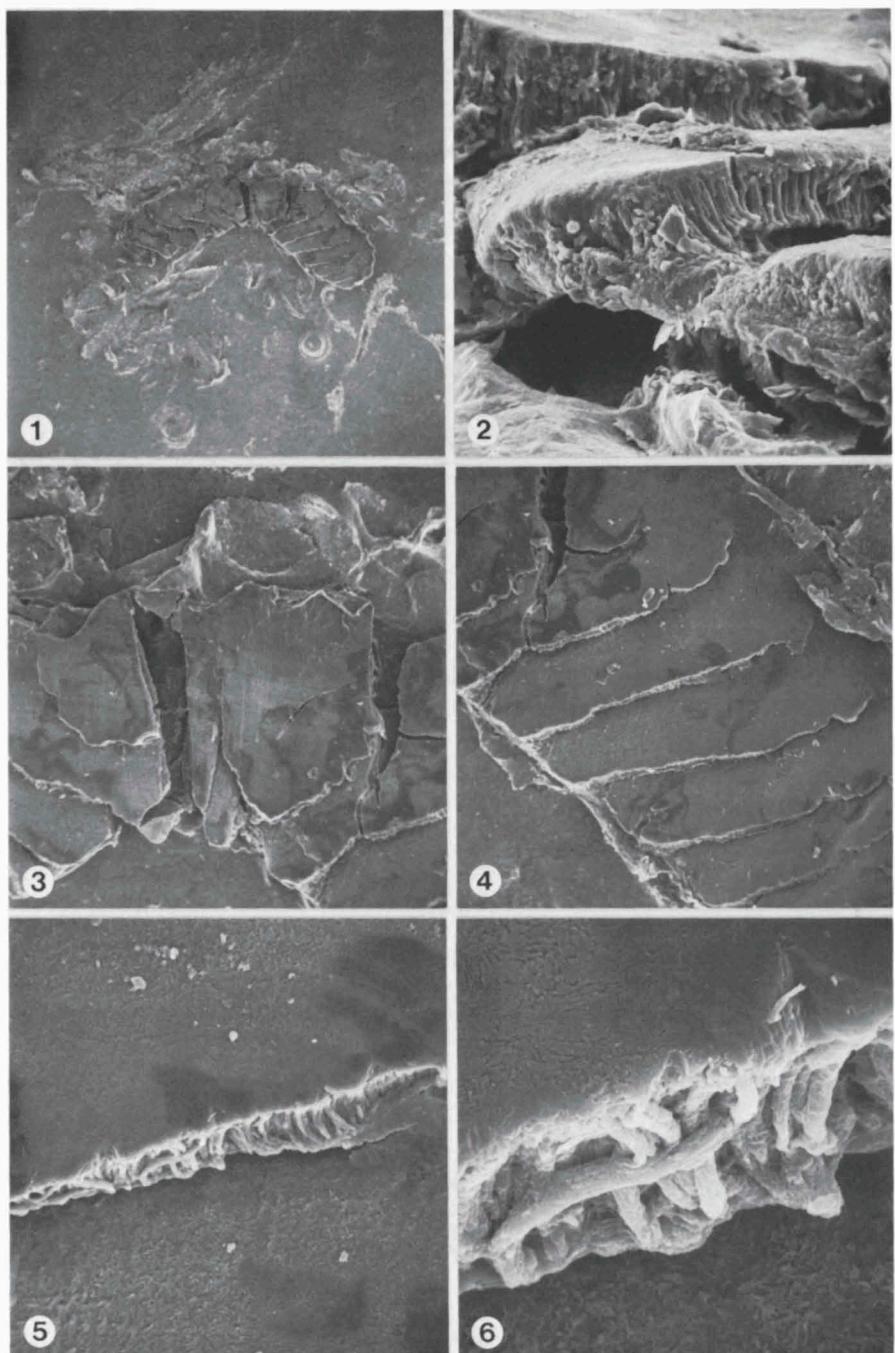

Plate 2. Mandibula of *Orthalicus zebra* (Müller); Trinidad, Caspary Island (RMNH). Fig. 1. Anterior view;  $\times 21$ . Fig. 2. Ventro-lateral view of central plate (above) and lateral plate;  $\times 500$ . Fig. 3. Detail of central plate;  $\times 105$ . Fig. 4. Detail of left lateral plates;  $\times 105$ . Fig. 5. Detail of edge of lateral plate;  $\times 525$ ; Fig. 6. Detail of fig. 5, with "pillars" or hair-like structures;  $\times 2100$ .

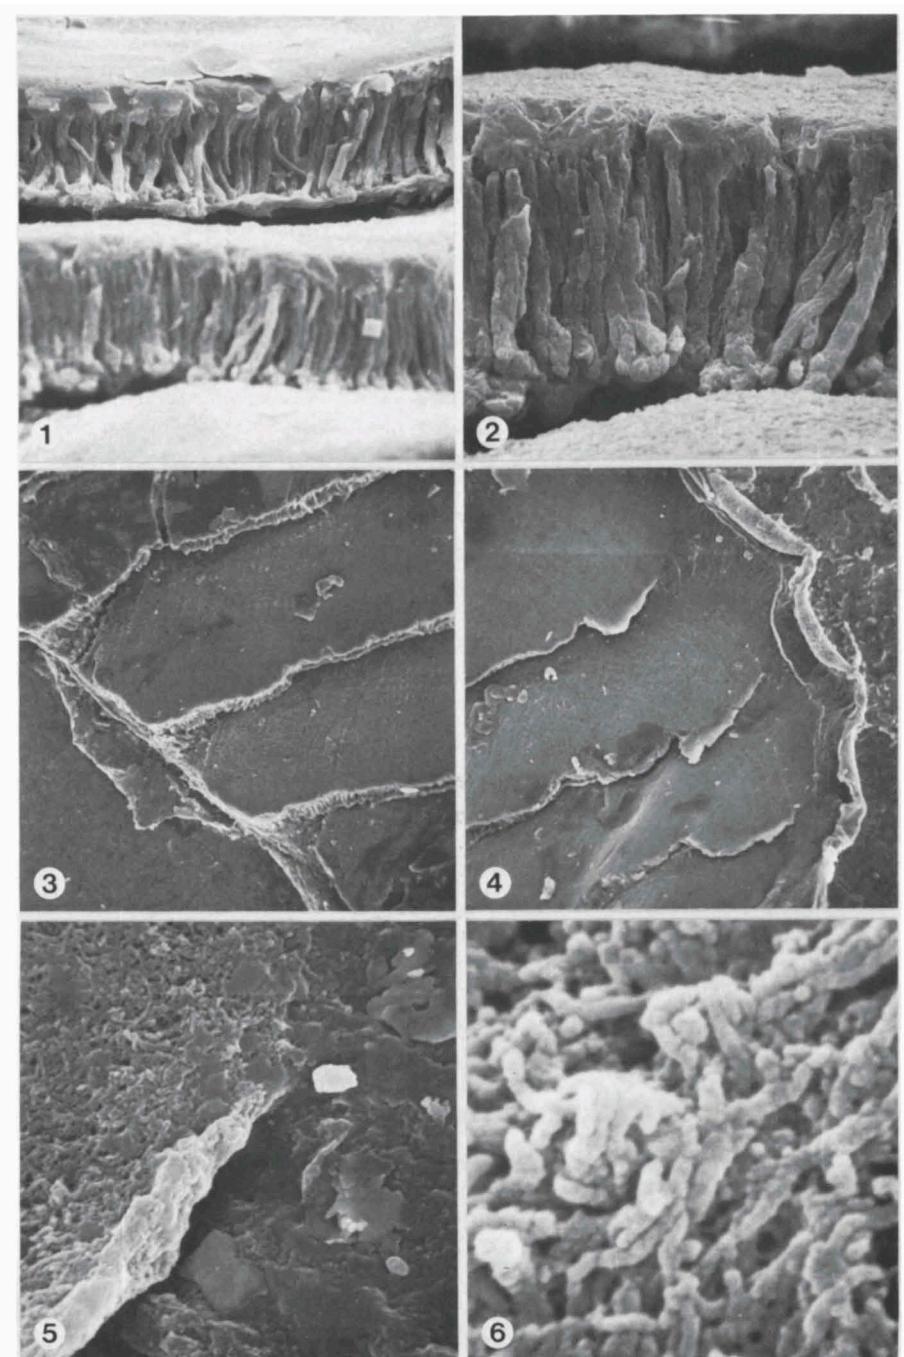

Plate 3. Mandibula of *Orthalicus zebra* (Muller); Trinidad, Casparee Island (RMNH). Fig. 1. Lateral view of overlapping plates;  $\times 1000$ . Fig. 2. Detail of fig. 1;  $\times 2000$ . Fig. 3. Ventral edge of mandibula with signs of wear;  $\times 210$ ; Fig. 4. Dorsal view of lateral plates;  $\times 210$ ; Fig. 5. Detail of fig. 4;  $\times 5250$ ; Fig. 6. Detail of surface of a lateral plate, showing irregular interwoven "threads";  $\times 21000$ .

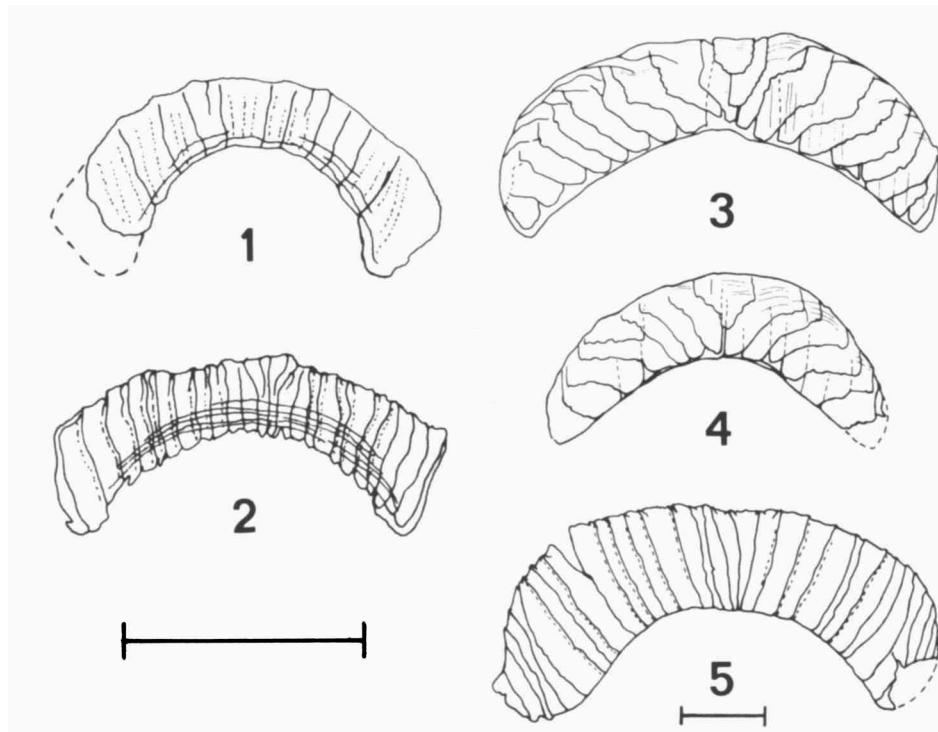

Fig. 33. Mandibulae. a. *Cyclodontina (Bahiensis?) rhodinostoma* (d'Orbigny); b. *Spixia doello-juradoi* (Parodiz); c. *Placostylus (Maoristylus) shongii* (Lesson); d. *Orthalicus melanocheilus* (Valenciennes); e. *Liguus fasciatus* (Muller). The scale lines equal 1 mm.

Group B  
(figs. 33a, b)

The number of plates on each side of the central plate is 4-12 (average: 6.9). The mandibula is very thin (transparent) with conspicuous grooves in the posterior side of the ventral part; these grooves run parallel to the ventral edge. The lateral sides of the mandibula are straight ending. The outermost lateral plates are (sometimes) strongly broadened. The central plate is rectangular or trapezoid, sometimes consisting of 2 or 3 fused plates, running from dorsal to ventral edge of the mandibula. Lateral plates are rectangular, either broad or narrow. The outermost plates are larger, with a short overlap. Free edges of the plates are parallel, running from dorsal to ventral edges of the mandibula. At a magnification of 250  $\times$  or more granulation nor "cells" or hair-like structures are visible.

Group C  
(fig. 33c)

The number of plates on each side of the central plate is 12-26 (average 16.1). The lateral sides of the mandibula are blunt. The central plate is an isosceles triangle with short (dorsal) base, running from the dorsal to the ventral edge of the mandibula. Lateral plates are rectangular, narrow (with short overlap), parallel to the sides of the central plate and perpendicular to the ventral and dorsal edges of the mandibula. At a magnification of 250 $\times$  or more no granulation nor "cells" or hair-like structures have been observed.

APPENDIX 2

Radula structure

Species	Formula
<b>Odontostominae</b>	
<i>Cyclodontina (Bahiensis) rhodinostoma</i>	C/3 + LM 23/2 (-3)
<i>Clessinia cordovana stelzneri</i>	C/3 + LM 18/2
<i>Plagiodontes dealdalea</i>	C/3 + LM 28/2
<i>P. weyembergii</i>	C/3 + LM 32/2
<i>P. spec.</i>	C/3 + LM 29/2
<i>Spixia aconigastana</i>	C/3 + LM 29/2
<i>S. doellojuradoi</i>	C/3 + LM 22/2
<i>S. pyrgula</i>	C/3 + LM 31/2
<i>S. spixii</i>	C/3 + LM 27/2
<i>Odontostomus odontostomus</i>	C/3 + LM 29/2
<i>O. paulistus</i>	C/1? + LM 20/2
<i>O. tadiculatus</i>	C/3 + LM 28/2(-3)
<b>Orthalicinae</b>	
<i>Liguus fasciatus</i>	C/1 + L 3/1 + M x/1(-2)
<i>Orthalicus ferussaci</i>	C/1 + LM 97/1(-2)
<i>O. maracaibensis</i>	C/1 + LM 29/2
<i>O. princeps</i>	C/1 + LM 80+x/1(-2)
<i>O. undatus</i>	C/1 + LM 68+x/1(-2)
<i>O. zebra</i>	C/1 + LM 70+x/1(-2)
<i>O. zonifera</i>	C/1 + LM 70+x/1(-2)

<i>O. spec. A</i>	C/1 + LM 79/1
<i>O. spec. B</i>	C/1 + LM 74+x/1
<i>Porphyrobaphe iostoma</i>	C/1 + L 2/1 + M 38+x/2
<i>P. iris</i>	C/1 + L 4/1 + M 66+x/2
<i>P. irrorata</i>	C/1 + L 2/1 + M 48 + x/1(-2)

**Placostylinae**

<i>Placostylus (Maoristylus) ambagiosus</i>	C/3 + LM 50/2(-3)
<i>P. (M.) shongii</i>	C/3 + LM 58/2
<i>P. (P.) porphyrostomus</i>	C/3 + LM 34/2

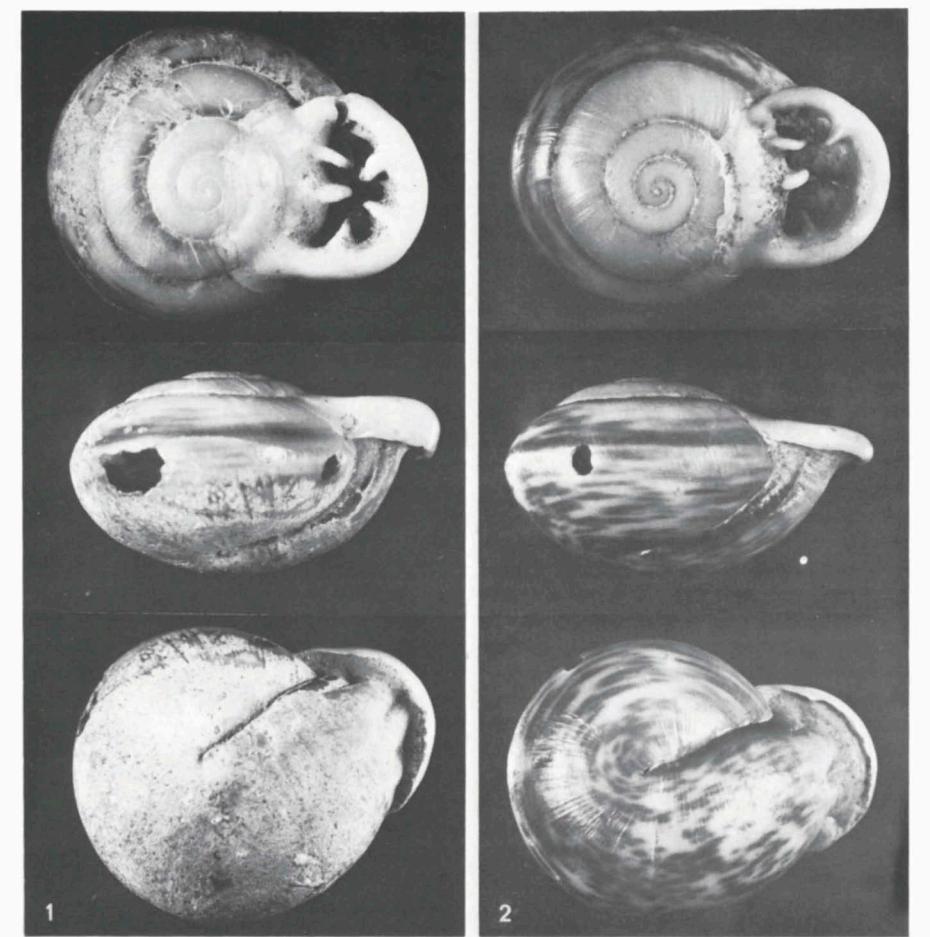

Plate 4. Fig. 1. *Anostoma lutzelburgi* Weber, lectotype (München museum); shell height 30.5 mm.  
 Fig. 2. *Anostoma rossi* Weber, lectotype (München museum); shell height 29.5 mm.

BIBLIOGRAPHY OF THE BULIMULINAE SUBFAMILIES ODON-TOSTOMINAE, ORTHALICINAE AND PLACOSTYLINAE, WITH ADDITIONAL REFERENCES

(The following abbreviations are used to indicate the subfamilies: Od, Odon-tostominae; Or, Orthalicinae; P, Placostylinae.)
