

NOTE XLVII.

ON THE GEOGRAPHICAL
DISTRIBUTION OF SOME LITTLE-KNOWN
AFRICAN SPECIES OF NIGIDIUS.

BY

J. R. H. NEERVOORT van de POLL.

1. *Nigidius amplicollis* Qued. (Berl. Ent. Zeitschr. XXVIII (1884) p. 266), first recorded from the Quango (v. Mechow) proves to be a widely distributed species. I have specimens from the Upper Zambesi and from the N'Guru mountains (Zanzibar).

2. *Nigidius laevigatus* Har. (Mittheil. d. Münch. Ent. Ver. II (1878) p. 100 & Coleopt. Hefte XVI (1879) p. 31)¹⁾, originally described from a specimen captured by Dr. Pogge in the interior of tropical Africa (Lunda-land), then recorded by Quedenfeldt from the Quango, extends its range also towards the East-Coast, my specimen being from Lake Nyassa.

3. *Nigidius dentifer* Alb. (Deutsch. Ent. Zeitschr. XXVIII (1884) p. 16), has been described from Central-Africa, without indication of its more peculiar habitat. A specimen in my cabinet was taken at Old Calabar.

1) Von Harold provisionally published short latin diagnoses and afterwards in the „Coleopterologische Hefte“ full descriptions. One of both citations, I found generally overlooked. Quedenfeldt only quotes the description of *N. laevigatus* Har. with a wrong page.
