

NOTULAE AD FLORAM AGARICINAM NEERLANDICAM — VI-VII  
RICKENELLA AND OMPHALINA

THOMAS W. KUYPER

*Rijksherbarium, Leiden*

VI. *Rickenella* Raithelhuber

*Rickenella swartzii* (Fr.) Kuyp., comb. nov. — *Agaricus swartzii* Fr., Obs. mycol. 1: 90. 1815 (basionym).

This species has been known thus far as *Rickenella setipes* (Fr.: Fr.) Raithelhuber. However, the original diagnosis of *Agaricus setipes* (Fries, 1818: 162) clearly refers to another species, as *A. setipes* was characterized as follows: pileus 5–8 mm broad, campanulato-convex; stipe very long, 85–100 mm, setaceous; lamellae greyish; strongly resembling *Agaricus corticola* Pers.: Fr. As far as I can ascertain this protologue refers to a species of *Mycena*. The misapplication of the name *Agaricus setipes* might have arisen when Fries (1873: pl. 75 f. 4) published an illustration of an unnamed variety of *A. setipes*, which undoubtedly represents *Rickenella swartzii*. This unnamed variety was later (Fries, 1874: 164) called *A. setipes* var. *acrocyaneus*.

The use of the epithet *swartzii* is in accordance with Kühner (1938: 608), Smith (1947: 123) and Dennis & al. (1960: 122).

VII. *Omphalina* Quél.

Furthermore a new combination in *Omphalina* seems desirable:

*Omphalina viridis* (Hornem.) Kuyp., comb. & stat. nov. — *Agaricus umbelliferus* var. *viridis* Hornem., Fl. dan. 10 (28): 10. 1819 (basionym).
